MDCCCLI.

PREFACE.

PERHAPS no statement connected with the appearance of this work is calculated to create more surprise than that the greater portion of it was actually in type prior to the first of May. Its condition at that period may be thus described. The manuscript accounts of the articles of a large number of the Exhibitors had been compiled, set up in type, and subsequently condensed, annotated, and revised, and required but a little more attention to fit them for publication. In addition, a large proportion of the illustrations were completed and fit for printing. But at that moment, what was the condition of the Exhibition Building itself? Only on the morning of the first of May were tickets affixed to a few articles in a few Classes, and the position of many Exhibitors, even on the British side, was not finally determined. This arose out of the efforts made to obtain a strictly classified arrangement of articles on this side. Many articles placed in the hurry of preparation in the space allotted to one Class were improperly thus placed, and required to be removed to other Classes, and a large number of explanations were found to have been received from Exhibitors who had ultimately not been able to send in their goods in time. Whilst many Classes were arranged rapidly, others remained, owing to peculiar difficulties, in a state of great incompletion, and incessant alterations of the numbers and position of the Exhibitors were necessary before they could be considered perfect. During this time, which is to be reckoned by weeks rather than days, the number of additional manuscripts received from Exhibitors, who had neglected sending them in until long after the opening of the Exhibition, was immense, and the adjustment of the additional matter thus created was in itself a difficulty not to be easily subdued.

While an amount of order—surprising in its extent, though imperfect in the degree requisite for the publication of a work so costly in its preparation as the present—reigned on the British side of the Building, the state of that devoted to other nations could scarcely be entitled to that term until a month subsequent to the day of opening. Many foreign states had not sent in their catalogues, and the arrangement of their productions was very imperfect.

The peculiar nature of the Catalogue, also, as a work produced by many thousand authors, naturally brought upon it, through the medium of the small Catalogue, the corrections of a large number of those whose manuscripts formed its foundation, in addition to those rendered necessary, in order to obtain some degree of uniformity in the literary composition.

The combination of the elements of disorder thus presented has never before arisen to oppose the publication of any work in this or other times; and its effect upon its preparation is only to be estimated by those who have watched its progress, and are familiar with the complicated arrangements necessarily preceding the production of any printed book containing illustrations. The great extent of the Catalogue rendered the disturbance of any of its parts absolutely fatal to its publication in a reasonable time, and even in a moderate condition of accuracy. In the midst of all these adverse circumstances an attempt was made to publish it as speedily as possible after the opening of the Exhibition; but this attempt was rendered fruitless in consequence of the ceaseless accessions of additional matter, and of the alterations of position in that already set up.

Under these circumstances the Contractors, anxious to produce so extensive a work in as perfect a condition as possible, resolved, at considerable loss to themselves, to delay its appearance until every alteration of importance had been made in the arrangement of the Building and by Exhibitors themselves. In this state it is now published, and is intended to serve as a lasting memorial of the splendid collection of which it professes to be the exponent. When its magnitude is considered, and the regard had to the great difficulties inseparable from the production of an illustrated book of this kind, it must be acknowledged that the period occupied in its publication has been comparatively brief and its preparation rapid.

The due appearance of the smaller Catalogue, on the first of May,—in itself, perhaps, one of the most remarkable instances of rapid typographical execution ever accomplished,—is also an indication of the substantive pre-existence of the present work before that date, since the smaller Catalogue is only a very condensed summary of the present, and was derived from the material forming the illustrated edition. The difficulties attending the publication, even of that work, may be gathered from the fact, that only three days before it appeared was the order of succession and temporary arrangement of the Exhibitors in the Building determined on; and in that short interval, and before its publication, their arrangement in the Catalogue had much of it to be made.

For an account of the method adopted in the preparation of this Catalogue reference should be made to another page. It is, however, due to those whose valued assistance has added so much to the permanent interest which will attach to this work to state, that there are several portions which could not, by pressure of time, be submitted to the benefit of their revision, and for such, and the general scientific accuracy of the work, the subscriber to this notice must be considered alone accountable. That the following pages are to be considered free from technical and scientific inaccuracies could scarcely be expected; but much care and labour have been expended to give them, as far as possible, this character.

The consideration just named may also render expedient, if not necessary, a simple statement of the part fulfilled by the writer in connection with this work. The production of the general plan of the book, its development after sanction by the Executive Committee, and literary construction out of the crude material obtained after compilation from the manuscripts of Exhibitors—this material resulting from the official instructions given for the compilation of the Catalogue, and the term compilation including, in this case, merely the rough preparation of Exhibitors' manuscripts for setting up in type, the resulting matter being consequently in a very imperfect state—with the general literary and scientific superintendence and management of the work—these have formed the occupation of the writer in connection with it, and for these he may be held responsible. As the result of the combined labours of the scientific annotators and of the writer, and after having received official sanction and revision on the part of the Executive by the officer appointed, this Catalogue is now put forth. The constant effort of the writer has been to prepare a work of permanent value and enduring interest. May it be shown in the issue that the labour bestowed upon it has not been in vain.

At the period when this work makes its appearance in a complete state, the Exhibition is about to close. The first function of a Descriptive Catalogue can therefore scarcely be fulfilled ere the great spectacle it illustrates will pass away. To those wonders of Art and Industry which man, taught by God, has been by Him enabled to accomplish, it will prove a guide but for a brief period. But its more permanently valuable offices then commence; and it may be reasonably hoped that, as a record of the most varied and wonderful collection of objects ever beheld, and as a book of reference to the philosopher, merchant, and manufacturer, it will constantly prove both interesting and instructive to the reader.

It is probable that, with the return of the Exhibitors and of the articles to the numerous localities abroad whence they were derived, copies of this Catalogue will be sent, and taken also, and that these pages will be read in many lands long after the Exhibition shall have become matter of history. May they be found, on examination, to contain nothing which is not in harmony with the spirit of the motto on the title-page; and, while descriptive of the successful labours of man, may it not have been forgotten that the glory and praise are due to God alone.

Robert Ellis.

Chelsea, 1851.

Table of gold and silver electro-plate	Her Majesty	—	—	111
Compartments of electro-deposit table-top	Her Majesty	—	—	—
Table-top in silver	Her Majesty	—	—	—
Shield presented by the King of Prussia to H. R. H. the Prince of Wales	H. R. H. Prince Albert	—	—	—
Theseus and the Amazons	H.R.H. Prince Albert	—	—	—
Portion of a slab for a table	H.R.H. Prince Albert	—	—	—
Mineral map of the United Kingdom	Hunt, Robert	I.	—	156
Improved blasting cartridge	Rogers, E., F.G.S.	—	430	160
Diagram of a section and plan of a shaft	Ditto	—	—	—
Coal-fields of Europe, and of the United States and British North America	Austed, D. T., F.R.S.	—	—	166
Ground plan, elevation, and sections of furnace, chimneys. &c.	Buccleuch, His Grace the Duke of,	—	509	175
Crystals of sulphate of iron	Spence, Peter	II.	7	186
Nutt's beehives	Bentley, John F.	III.	4	201
Patent marine trunk engines	Penn, J., & Son	V.	8	211
Marine oscillating engines	Ditto	—	—	212
Pendulous high-pressure engine, side and front elevation	Joyce, William	—	20	213
Patent double cylinder steam-engine	McNaught, William	—	22	—
Steam pump, front and end elevation	Garrett, William Elliot	—	35	214
Patent feathering screw propeller, in action and out of gear	Maudsley, Sons, & Field	—	38	215
Double cylinder marine engines, end and side elevation	Ditto	—	—	216
Direct acting oscillating cylinder steam-engines, end and side elevation	Ditto	—	—	—
Double piston-rod engines, for shallow-river navigation, end and side elevation	Ditto	—	—	—
Marine beam steam-engine, end and side elevation	Ditto	—	—	217
Annular cylinder marine engines, end and side elevation	Ditto	—	—	—
Horizontal direct-acting marine engines for screw propulsion, end elevation and plan	Ditto	—	—	—
Oscillating engine	Clayton & Shuttleworth	—	39	218
A new method of converting rectilinear into rotatory motion	FitzMaurice, Hon. W. E.	—	57	219
Rotatory engine, front elevation and section	Morrell, G.	—	82	221
Fire annihilator, entire and in section	Phillips, William H.	—	92	222
Balance valves, &c., in section	Erskine, Daniel	—	100	—
Hollow furnace-bars and fire-bars	Frith, T. & J.	—	119	224
Model, showing improvements in lubricating	Hurry, H. C.	—	122	—
Carriage fire-engine	Merryweather, M.	—	401	226
Cabinet fire-engine	Ditto	—	—	227
Improved Brigade fire-engine	Shand & Mason	—	410	228
Patent weighing crane	James, J., & Co.	—	411	—
Small patent weighing machine	Ditto	—	—	—
Hydraulic press, employed in raising the Britannia Bridge	Bank Quay Foundry Co.	—	412	229
The press shown in operation, and end elevation	Ditto	—	—	—
Patent tubular crane, side and back view	Fairbairn, W., & Sons	—	417	231
Overshot water-wheel	Warner, J., & Sons	—	424	233

Description of Illustrations.	Name of Exhibitor.	Class.	No.	Page.
Patent steam travelling crane, end and side elevation	M'Nicholl & Vernon	V.	434	233
High-pressure fire-engine	Smith, R., & Son	—	449	235
Ornamental fountain	Roe, Freeman	—	462	—
Patent vulcanized India-rubber water-taps	Lambert & Son	—	478*a*	236
Patent coupling for railway waggons	Thornton, J., & Sons	—	490	—
Hydraulic lifting jack	Ditto	—	—	237
Improved lifting screw-jack	Ditto	—	—	—
Crampton's patent express engine	L. and N. W. Railway Company	—	512	238
The "Cornwall" express narrow-gauge engine	Ditto	—	513	—
Locomotive double-boiler tank engine, side and half end elevation	Wilson, E. B., & Co.	—	526	239
Improved covered railway waggons, end elevation	Henson, Henry H.	—	532	—
Improved covered railway waggons, side elevation	Ditto	—	—	240
Locomotive tank engine	Kitson, & Co.	—	534	—
Locomotive engine	Hawthorn, R. & W.	—	536	—
Cross section of patent permanent way for railways	Hoby, James W.	—	614	244
Patent traversing machine	Dunn, T.	—	618	—
Patent traversing machine, side elevation and plan	Ormerod, R., & Son	—	624	245
Dunn's patent turn-tables, sections and plan	Ditto	—	—	—
Patent charcoal tire for railway wheels and rails and patent axle	Thorneycroft, G.B., & Co.	—	636	246
Automatic apparatus for mail trains, ground plan	Dicker, John	—	674	248
Elevation of the same	Ditto	—	—	249
Patent turn-table for railways	Greenway, Charles	—	698	250
Triform railway signal	Hoy, Joseph	—	710	251
Machine for ascertaining and recording the weight of goods	Morris, William	—	764	252
Improved lever weighing machine	Nicholl, W., Lewis & Co.	—	770	—
Dial weighing machine	Ditto	—	—	—
Improved engine counter	Richmond, John	—	775	—
Portable weighing machine	Craig, John	—	776	253
[illegible] weighing machine	Ditto	—	—	—
Elevation of office and railway weigh bridge	Pooley, Henry	—	784	—
Internal construction of weigh bridge	Ditto	—	—	254
Platform weighing machine	Ditto	—	—	—
Improved sociable	Booker, E., & Sons	—	809	255
Patent park phaeton	Cook, Rowley, & Co.	—	816	—
Improved patent wheel, elevation and side view	Crosskill, Edmund	—	826	256
Section of globular nave	Ditto	—	—	—
Low-bodied dog cart	Fowler & Fry	—	843	—
The "Amempton" carriage, closed	Kesterton, E.	—	894	257
The same carriage, open, as a barouche	Ditto	—	—	—
Improved pony carriage	*Mason, W. Henry*	—	910	258
Patent "dioropha," or two-headed carriage	Rock & Son	—	956	259
Improved carriage for invalids	Willoughby, Solomon	—	992	260
Perspective view, showing Messrs. Hibbert & Platt's cotton machines (lap and carding machine), and Messrs. Hicks and Son's high-pressure steam-engine and driving-gear	Hibbert & Platt	VI.	1	263
Perspective view, showing Messrs. Hibbert and Platt's cotton machinery, (power-looms, throstles, and mules), and Messrs. Hicks and Son's steam-engine and driving gear	Ditto	—	—	267
Carding engine	Mason, J.	—	10	269
Patent slubbing and roving frame and collars	Ditto	—	—	—
Modern power loom	Harrison, J.	—	18	270
Old power loom	Ditto	—	—	—
Patent self-acting mule	Macindoe, G. Park	—	24	—
Models of patent sizing and warping machine	Hornby & Kenworthy	—	20	—
A large Jacquard loom	Taylor & Son	—	23	272
Patent spinning frame	Sutcliffe, R.	—	42	273
Improved heald machine	Judkins, C. Fiot	—	52	274
Sample of healds	Ditto	—	—	—
Sewing machine	Ditto	—	—	—
Flax seeding machine	Robinson, Richard	—	54	275
Metal disc, for scutching flax	Plummer, Robert	—	74	276
Front elevation of rotatory disc scutching mill	Ditto	—	—	—
Improved flax-breaking machine, side and front elevation	Ditto	—	—	—
Improved holders, for flax-heckling	Ditto	—	—	—
Double cylinder heckling machine, side elevation	Ditto	—	—	—
Double cylinder heckling machine, end elevation	Ditto	—	—	277
Patent double action Jacquard loom	Barlow, Alfred	—	82	279
Applegath's printing machine	Ingram, Herbert	—	122	281
Printing machine	Cowper, Edward, F.R.S.	—	134	282
Embossing press	Jarrett, Griffith	—	154	284
Improved galley press	Harrild & Sons	—	157	—
Plough-cutting machine	Ditto	—	—	—
Numerical printing machine	Ditto	—	—	—
Patent registering compass	Napier, D., & Son	—	158	285

Description of Illustrations.	Name of Exhibitor.	Class.	No.	Page.
Hydro-electric machine	Watson, Henry	VI.	165	285
Patent valve, for fluids	Ditto	—	—	286
Patent riveting machine, side elevation	Fairbairn, W., & Sons	—	200	—
Plan of the same	Ditto	—	—	287
Self-acting foot-lathe	Whitworth & Co.	—	201	—
Self-acting duplex lathe	Ditto	—	—	—
Self-acting duplex railway wheel turning lathe	Ditto	—	—	288
Self-acting planing machine	Ditto	—	—	—
Self-acting universal shaping and planing machine	Ditto	—	—	289
Self-acting slotting and shaping machine	Ditto	—	—	—
Self-acting vertical drilling and boring machine	Ditto	—	—	—
Self-acting radial drilling and boring machine	Ditto	—	—	—
Punching and shearing machine	Ditto	—	—	290
Self-acting wheel-cutting and dividing machine	Ditto	—	—	—
Self-acting bolt-head and nut-shaping machine	Ditto	—	—	—
Patent screwing apparatus	Ditto	—	—	291
Powerful self-acting planing machine	Sharp, Brothers	—	204	—
Steam riveting machine	Garforth, W. J., & J.	—	208	292
Hydraulic press	Hick, B., & Son	—	218	293
Two-horse oscillating steam-engine	Ditto	—	—	—
Patent forging machine	Ryder, W.	—	222	294
Coining-press	Maudslay, Sons, & Field	—	228	—
Patent mould-making machine, side and front elevation	Stewart, D. Y., & Co.	—	238	296
Patent tile-machine	Hart, James	—	308	297
Patent tenoning machine	Furness, William	—	401	298
Forms for rubbing surfaces	Schiele, C.	—	402	—
Grinding mill for vegetable substances	Crosskill, William	—	404	299
Mill for mineral substances	Ditto	—	—	—
Patent coffee-roasting apparatus	Dakin & Co.	—	408	300
Steam sugar-cane crushing mill	Robinson and Russell	—	418	—
Hydraulic seed presses	Blundell, Spence, & Co.	—	420	302
Mill to grind bark	Huxhams & Brown	—	446	303
Centrifugal washing and drying machine (for hand power)	Manlove, Alliott, & Co.	—	454	304
Centrifugal washing and drying machine (for steam power)	Ditto	—	—	—
Machine for roasting coffee	Law, W.	—	460	—
Patent refrigerator	Lawrence, James	—	604	306
Patent soda-water machine	Tyler, Hayward, & Co.	—	605	—
Double soda-water machine	Tylor & Son	—	606	307
Diving dress and helmet	Siebe, Augustus	VII.	1	309
Brunel's wrought-iron bridge over the Wye	Finch & Willey	—	9	310
Improved compasses	Bermingham, Thomas	—	13	—
Block of union paving	Woods, F. F.	—	42	313
Straight-grooved blocks, parallel and continuous	Ditto	—	—	314
Straight-grooved blocks, parallel and discontinuous	Ditto	—	—	—
Zig-zag grooved planks	Ditto	—	—	—
Equilateral perforated blocks	Ditto	—	—	—
Circular perforated blocks	Ditto	—	—	—
Hexagonal perforated blocks	Ditto	—	—	—
Smoke removal plan	Devey, George	—	54	315
Patent effluvia traps	Lowe, Alice, & Co.	—	62	316
Universal telegraphic lighthouse	Wells, George	—	82	318
Assimilation of railway gauges	Smith, B.	—	96	319
Views of the great suspension bridge at Kieff	Vignoles, Charles	—	105	321
Suspension aqueduct over the Calder	Leather, John W.	—	107	322
Cast-iron bridge over the Aire	Ditto	—	—	323
Catadioptric apparatus	Wilkins & Letourneau	—	157	326
Improved revolving apparatus for a light vessel	Ditto	—	—	327
Patent marine signals	Rettie, Robert	—	159	328
Wind guard for chimney tops	Green, Isaac	—	186	329
Porter's patent anchor	Honiball, James	VIII.	95	339
Registered marine signal lamp	Gilbert, Edward	—	120	340
Bow, stern, and transverse sections of H. M. S. "Queen"	The Admiralty	—	146	342
Lightning conductors for ships	Harris, Sir W. Snow	—	150	345
New propeller for steam vessels	Penrice, Lieut. R. E.	—	173	347
Duplex rudder and screw propeller	Carpenter, Capt. E. J.	—	194	350
Ornamented presentation cimeter	Wilkinson & Son	—	200	351
New officers' infantry helmet	Landon & Morland	—	204	352
India-rubber air-gun	Shaw, J.	—	254	357
Patent safety gun	Forsyth & Co.	—	256	—
Waterproof gun	Erskine, James	—	257	—
Working model of a twin-stern steam-ship	Sturdee, A. B.	—	337	362
Model of H.M. steam-ship "Medea"	Hudson, J., jun.	—	338	363
Two-horse portable steam-engine; end elevation	Stanley, W. Proctor	IX.	1	365
Registered steam cooking apparatus for farmers	Ditto	—	—	—
Chaff-engine	Ditto	—	—	—

Description of Illustrations.	Name of Exhibitor.	Class.	No.	Page.
Improved draining plough and windlass	Fowler, John, jun.	IX.	28A	367
Six-horse portable steam-engine	Burrell, Charles	—	37	368
Hurdle-making machine	Ditto	—	—	—
Gorse-cutting and bruising machine	Ditto	—	—	—
Brick, tile, and pipe making machine	Clayton, Henry	—	47	369
Broad-cast sowing machine	Watt, James	—	63	370
Sheep-dipping apparatus	Bigg, Thomas	—	65	371
Improved chaff-engine	Gillett, John	—	78	372
Crushing and grinding mill	Woods, James	—	82	—
Chaff-cutting machine	Cornes, James	—	83	—
Instrument for fumigating plants	Brown, David S.	—	91	373
Temple beehive	Pettit, Wyatt J.	—	92	—
Enamelled stable fittings	Cottam & Hallen	—	109A	375
Locomotive steam-plough	Usher, James	—	123A	376
Union mill for splitting and bruising seeds	Wedlake, Mary, & Co.	—	127	377
Chaff-cutting and oat-bruising machine	Ditto	—	—	—
Four-horse power portable steam-engine	Barrett, Exall & Andrews	—	128	—
Four-horse power thrashing machine	Ditto	—	—	378
Patent horse-gear for the same	Ditto	—	—	—
Iron thrashing machine	Ditto	—	—	379
Cam chaff-cutter	Ditto	—	—	—
Universal crushing mill	Ditto	—	—	—
Iron two-wheel plough	Ditto	—	—	380
Clod-crusher	Crosskill, W.	—	135	381
Norwegian harrow	Ditto	—	—	—
One-horse cart	Ditto	—	—	—
Pair-horse waggon	Ditto	—	—	—
Liquid manure cart	Ditto	—	—	382
Steam-engine, fixible or portable	Ditto	—	—	—
Beating machine	Ditto	—	—	—
Archimedean root-washer	Ditto	—	—	383
Seed-cleaner and separator	Gillam, John	—	138	—
Wrought-iron skim	Hill, E., & Co.	—	140	384
Expanding horse-hoe	Ditto	—	—	—
Wrought-iron gates and posts	Ditto	—	—	—
Wrought-iron hurdles	Ditto	—	—	385
Seeding drill	Garrett & Son	—	142	385
Turnip drill	Ditto	—	—	—
Patent horse-shoe	Ditto	—	—	386
Patent thrashing-machine	Ditto	—	—	—
Portable steam-engine	Ditto	—	—	—
Patent iron harrows	Williams, W.	—	151	388
Patent wrought-iron plough	Ditto	—	—	—
Chaff-engine	Ditto	—	—	—
Drain-pipe and tile-machine	Ditto	—	—	—
Improved Taylor's horse-drag rake	Ditto	—	—	—
Four-horse bolting thrashing-machine	Blyth, R. J.	—	154	389
Agricultural chimney filter drain	Sadler, W. J.	—	156	—
Patent tank-cleaner	Deane, Dray, & Deane	—	180	390
Patent water-engine	Ditto	—	—	—
Howard's, J. K., plough	Ditto	—	—	—
Howard's, J. A., plough	Ditto	—	—	—
Patent corn-mill	Ditto	—	—	391
Four-horse portable steam-engine	Turner, E. R.	—	182	—
Steam-boiler feeding apparatus	Ditto	—	—	—
Crushing-mill	Ditto	—	—	392
Broad share and subsoil plough	Bentall, Edward H.	—	217	394
Patent seed-drill	Hornsby, R., & Son	—	233	395
Patent manure-drill	Ditto	—	—	—
Patent drill-machine	Ditto	—	—	—
Six-horse power portable steam-engine	Ditto	—	—	396
Patent corn-dressing machine	Ditto	—	—	—
Patent double-acting turnip-cutter	Key & Mitchell	—	237	396
Patent iron plough	Howard T. & F.	—	240	397
Patent iron harrows	Ditto	—	—	—
Thrashing machine	Holmes & Sons	—	241	397
Manure-sowing machine	Ditto	—	—	—
Six-horse power portable steam-engine	Clayton, Shuttleworth, & Co.	—	242	398
Agricultural mill	Clayton, & Co.	—	—	—
Thrashing-machine	Ditto	—	—	—
Ornamental conservatory	Weeks, J., & Co.	—	248A	399
Patent rotatory garden pump	Siebe, A.	—	255A	400
Patent chaff-cutter	Smith, J.	—	256	—
Patent grass-cutter	Ferrabee, J., & Sons	—	274	401

Description of Illustrations.	*Name of Exhibitor.*	*Class.*	*No.*	*Page.*
Cottage, observatory, and other beehives	Neighbour, G., & Son	IX.	290	402
The "Royal Alfred," and other hives	Milton, John	—	291	—
Munn's bar and frame beehives	Ditto	—	—	403
Black marble timepiece	Adams, Thomas	X.	14	408
Imitation oak timepiece	Ditto	—	—	409
Marine chronometer	Delolme, Henry	—	19	—
The "Polyhorion" or many-hour clock	Tanner, William	—	28	411
Improved compensating balance	Pennington, J.	—	53	412
New calibre for watches	Frodsham, C.	—	57	414
Plan of an escapement	Hall, G. F.	—	60	415
Pendulum with micrometrical adjustment	Ditto	—	—	—
Astronomical and meteorological clock	Ditto	—	—	416
Exeter clock	Brutton, Charles	—	96	418
Patent electro-magnetic clock (numerous illustrations)	Shepherd, Charles	—	128	419
Self-registering magnetometer	Brooke, Charles	—	144	423
Self-registering barometer	Ditto	—	—	424
Self-registering thermometer	Ditto	—	—	425
Atmospheric recorder	Dollond, George	—	146	427
Sectional working of the same	Ditto	—	—	—
Lawson's thermometer stand	Ditto	—	—	—
Improved barometer	Dobbie, William	—	166	430
Gilbert's tooth extractor	Matthews, William	—	181	—
Artificial hand	Little, Major	—	196	431
Large organ with modern improvements	Willis, Henry	—	209	432
Mechanical figure	Dunin, Count	—	210	433
Terrestrial globe	Newton, W., & Son	—	212	434
Planetarium	Ditto	—	—	—
Electro-galvanic machine	Horne, & Co.	—	220	—
Solid eye-piece	Reade, Rev. J. B.	—	254A	436
Registered heliographs	Penrose, Francis C.	—	318	443
Typhodeictor or storm-pointer	Lloyd, Lieut.-Col.	—	322	444
Patent power-engine	Brown, S.	—	335	447
Patent meter	Ditto	—	—	—
Planometer	Sang, John	—	338	448
Dial weighing and measuring machine	Siebe, A.	—	358	450
Table weighing machine	Young & Son	—	366	—
Magnetic balance	Fox, R. W.	—	377	451
Steam gauge	Baker, Henry	—	396	452
Vacuum gauge	Ditto	—	—	—
Registered typograph	Hughes, William	—	401	—
Fox's magnetic dip and intensity instrument	Wilton, William	—	402	—
Fox's miners' theodolite	Ditto	—	—	453
An electrophorous	Phillips, John, F.R.S.	—	411	454
Rain gauge	Ditto	—	—	—
Index mouthpiece	Whishaw, Francis	—	419	—
Electric telegraph	Alexander, W. R. S. E.	—	426	456
Electric telegraph instruments for hotels	Reid, William	—	427	—
Similar instruments for public companies	Ditto	—	—	—
Domestic telegraphs	Ditto	—	—	—
Patent electric telegraph, with and without cover	Henley, W. T.	—	428	457
Magneto-electric machine	Ditto	—	—	—
Copying electric telegraph	Bakewell, F. C.	—	433	459
Copper-covered glass apparatus for chemical purposes	Edwards, J. B.	—	438	461
Improved sounding-board for pianoforte	Cadby, C.	—	431	464
Registered pianoforte	Brinsmead, J.	—	474	465
Registered cottage pianoforte	Allison, R.	—	480	466
Twin semi-cottage pianoforte, front and side views	Jones, J. C.	—	481	—
Elizabethan new patent grand oblique pianoforte	Erard, P. O.	—	496	467
Violin, after M. Savart's description	Spurgin, Thomas	—	542	470
Silver flute	Card, William	—	546	471
Finger-board for enharmonic organ (front view and profile)	Robson, T. J. F.	—	559	472
An organ, in the Tudor style	Walker, J. W.	—	561	474
Pedestal planisphere	Mollison, J.	—	585	475
Invalid couch	Chapman, T.	—	601c	476
Apparatus for applying medicated vapour	Downing, C. T., M.D.	—	634	478
Lunar globe	Readhouse, C.	—	677	*469
Improved pianoforte	Oetzmann & Plumb	—	683	*470
A salinometer	Mudie, David	—	683A	*471
Ornamental clock-case	Walker, John	—	697	*472
Dioptric revolving light-house	Chance, Brothers, & Co.	—	742	*477
Silk trophy	Keith & Co.	XIII.	1	503
Banner of silk, grown in England by the late Mrs. Whitby	Houldsworth, J., & Co.	—	64	507
Racing whip, with emblematic design	Swaine & Adeney	XVI.	92	523
Patent elastic waist boots	Taylor & Bowley	—	181	524

Description of Illustrations.	Name of Exhibitor.	Class.	No.	Page.
Royal Bible, the top, back, and front as reflected in a mirror	Messrs. Leighton	XVII.	24	538
Commemorative shield of the Great Exhibition	Ditto	—	—	—
Specimen of antique binding	Gould, J.	XXVIII.	143	540
Specimen of antique binding	Westley, Josiah	XVII.	48	
Envelope folding-machine	Hill, E., & De la Rue, T.	—	76	542
Heraldic table-cloth	Underwood, W.	XVIII.	22	554
State bed	Faudel & Phillips	XIX.	165	566
Axminster carpet for Her Majesty's drawing-room, Windsor Castle	Watson, Bell, and Co.	—	337	572
Crimson satin eider-down quilt, with white satin border	Heal & Son	—	396	574
Patent guard razor	Stewart, C., & Co.	XXI.	21	592
Ornamental wire flower-table	Reynolds, John	XXII.	37	597
Ornamental iron bedstead	Tonkin, James	—	58	599
Patent iron bedstead	Cowley & James	—	62	600
Ornamental cast-iron vase	Handyside, Andrew	—	82	—
Registered conducting leaf-stove	Keene, W.	—	94	602
Interior of the same, showing the conducting leaves	Ditto	—	—	—
Improved Oxford range	Benham & Sons	—	98	602
Pyro-pneumatic stove-grate	Pierce, William	—	107	604
Louis Quatorze drawing room stove-grate	Ditto	—	—	—
Chased or-molu fender	Ditto	—	—	605
Ornamented fire-dogs	Ditto	—	—	—
Fish-carver and fork	Deakin & Co.	—	110	606
Fire-lump stoves (front views and vertical sections)	Deane, Dray, & Deane	—	186	613
Nautilus register-stove	Burton, W. S.	—	247	620
Ridgway & Co.'s cabinet water-closet	Stokes, J. C.	—	252	621
Hydrostatic syphon water-purifier	Bird, A.	—	267	623
Victoria night-light	Ditto	—	—	—
Gold ever-pointed pencil-case, with various combinations	Sheldon, J.	—	292	626
Ornamental gas-bracket	Potts, William	—	323	630
Electro-plated snuffer-tray	Sturges, R. F.	—	341	633
Electro-plated decanter-stand	Ditto	—	—	—
Electro-plated tea-urn	Ditto	—	—	634
Electro-plated tea-kettle and stand	Ditto	—	—	—
Electro-plated cake-basket	Ditto	—	—	—
Electro-plated candlestick	Ditto	—	—	—
Metallic bedstead	Peyton and Harlow	—	371	639
Four-post brass bedstead in the renaissance style	Winfield, R. W.	—	373	—
Metallic bedstead	Ditto	—	—	—
Two ornamental cots in brass	Ditto	—	—	—
Gas chandelier with parian figures (style of Francis I.)	Ditto	—	—	—
Bronzed gas chandelier, with ornamental enamel shades	Ditto	—	—	—
Sherwood range	Wakefield, F.	—	381	640
Dr. Arnott's oblong bronzed corrugated stove	Edwards, F.	—	387	641
Dr. Arnott's circular bronzed corrugated stove	Ditto	—	—	—
Dr. Arnott's chimney valves	Ditto	—	—	—
Enamelled copper bath	Tylor & Son	—	401	642
Ornamental tea-urn	Ditto	—	—	—
Copper coal-scuttle	Ditto	—	—	—
Radiating stove-grate	Gray, J., & Son	—	405	643
Portable cooking stove	Rigby, Peter	—	411	—
Patent dry gas-meter	Shears & Son	—	438A	645
Gas cooking range	Strode, William	—	443	—
Gas broiler	Ditto	—	—	—
Patent diamond table lamp	Clark & Restell	—	446	646
Pearl hanging lamp	Ditto	—	—	—
Patent diamond sideboard or reading-lamp	Ditto	—	—	—
Patent diamond table-lamp	Ditto	—	—	—
Patent star night-light	Ditto	—	—	—
Patent reflector for gas-lights	Ditto	—	—	647
Improved oil lamp, with reservoir below the light	Ditto	—	—	—
Patent distress signal-lamps	Rettie, M., & Sons	—	[illegible]	—
Improved ship's hearth	Goodbehere, G. T.	—	481	649
Ornamental bracket	Hale, T., & Co.	—	486	—
Patent vulcanized valve-cocks	Lambert, T.	—	534	652
Economic lamp	Ditto	—	—	653
Registered mangle	Tindall, E. O. D. L.	—	542	—
New elastic pressure mangle	Stutterd, J.	—	[illegible]	654
Patent rotatory knife-cleaning machine	Kent, G.	—	553	—
Transverse section of the same	Ditto	—	—	—
Perpendicular section of the same	Ditto	—	—	—
Aerating machine for soda-water	Masters, Thomas	—	634	658
Freezing-machine	Ditto	—	—	—
Rotatory knife-cleaner	Ditto	—	—	—
Fountain and park-gates in cast iron	Coalbrook Dale Company	—	641	659
Specimen of ornamental structure in cast-iron	Ditto	—	—	—

Description of Illustrations.	Name of Exhibitor.	Class.	No.	Page.
Bronzed flower-pot stand	Coalbrook Dale Company	XXII.	641	660
Serpent-handled vase and base	Ditto	—	—	—
Ornamental vase and base	Ditto	—	—	—
Patent holdfast, and fire-resisting safe	Milner & Son	—	642	661
Ornamental Gothic lantern	Hulett, David	—	643	662
Antique bronze candelabrum	Ditto	—	—	—
Patent Admiralty regulation lights	Miller & Sons	—	645	—
Steam-vessel with regulation lights	Ditto	—	—	663
Patent detector lock and key	Chubb & Son	—	646	—
Gothic lock and key	Ditto	—	—	—
Patent fireproof safe	Ditto	—	—	—
"Koh-i-noor" diamond case	Ditto	—	—	—
Patent penholder	Windle & Blyth	—	668	665
Patent Collinge hinges	Thrupp, H. J.	—	676	666
Irish railway signal-post	Boake, J. F.	—	697	668
Portable domestic vapour-bath	Culverwell, Wm.	—	754	669
Patent check indicator	Warner, J., & Sons	—	798	—
Vase in silver, emblematical of the great Exhibition	Elkington, Mason, & Co.	XXIII.	1	672
Antique vase	Payne & Sons	—	4	673
Safety chain brooches	Ellis, H., & Son	—	12	674
Ornamental brooch	Rettie, M., & Sons	—	24	675
Ornamental plateau	Wilkinson, T., & Co.	—	32	676
Etruscan tea-urn	Ditto	—	—	—
Ornamental venison dish	Ditto	—	—	677

ALPHABETICAL AND CLASSIFIED LIST OF ARTICLES

DESCRIBED IN THE CATALOGUE.

Memorandum.—Persons consulting this Index will find that the articles contained therein are arranged according to a principle by which the whole of a series of the same species are grouped together as far as practicable. *Ex. gr.*—Under "Magnesia" will be found "Magnesia, Bi-carbonate of," "Magnesia, Sulphate of," and so on. Under "Railways" will be found "Railway Axles," "Railway Bars," &c. &c. The references following each Article distinguish—1. The Class in the United Kingdom, the Colony, or Foreign Country in which the same will be found, and Name of Exhibitor; and 2. The number in the Catalogue borne by the entry to which the same is prefixed.

Absynthium—*Sardinia*, Saluce, 10.

Accident Detector—V. Angus, 716.

Accordions—*Austria*, Reinisch, 163. Steinkellner, 164.
  Zollverein (1), Wagner and Co., 701. (3), Zimmerman, 24.

Accordion-Stand—X. Faulkner, 530.

Account Books—XVII. Cowan & Sons, 101. Harris & Galabin, 373. Knight, 86. Rock & Co., 108. Royston & Brown, 205. Waterlow & Sons, 46.
  China, Copland. *France*, Gaymard and Gerault, 518.
  United States, Herrick, 502. M'Adams, 482. Sibell & Mott, 339. *See* also *Ledgers*.

Accoutrements, Military—*See Military Accoutrements*.

Accumulator—V. Armstrong, 44.

Acetic Acid—*Austria*, Wagenmann & Co., 19.

Acolyte (Patent Safety Candle-Cap)—XXIX. Jones, 95.

Aconite and its Preparations—II. Hopkins & Williams, 41. Morson & Son, 106. *India*, II.
  Spain, Tabala, 129.

Acorns—*Spain*, 93, 115.

Æolodian—*Zollverein* (1), Baltzer, 82.

Æolian Pitchpipes—X. Greaves, 503.

Æolian Violin Mute—X. Greaves, 503.

Æolophon—X. Storer, 529.

Aerating Machines—*See Soda-Water Machines. Vases, Syphon (for Aerated Waters).*

Aerial Currents Regulator—XXII. Edwards, 241.

Aerial Machines (Models)—X. Brown, 713. Graham, 233. Plummer, 716. Sadd, 301.—*See* also *Balloons, &c.*

Aerial Tinting—XXX. (Fine Art Court) Concanen, 2.

Agates—I. Dyer, 10. Gelling, 139. Tolan, 22. XXIII. Morel & Co., 117. *Canada*, Logan, 1.
  India, I.
  Zollverein (1), Eifler & Co., 891. Görlitz, 890. Keller & Co., 888. Wild & Robinson, 889.

Agave Fibre—*Barbadoes. Trinidad*, Lord Harris.

Agon, The Game of—XXIX. Peacock, 193.

Agra Marble (inlaid)—XXVII. Stewart, 33.

Agricultural Implements—IX. 1 to 279. XXI. Waldron & Sons, 17. XXII. Butterley, 240. Hutton, 166. Keep & Watkin, 76. Slagg, 158. Waldron & Sons, 17, 185.
  Austria, Horsky, 123. Magui, 126. Prince Lobkowitz's Agricultural Implement Manufactory, 124. Riesi-Stallburg, Baron, 125.
  Belgium, Claes, 163. Delstanche, 510. D'Omalius, 171. Romedenne, 165. Scheidweiler, 164. Train, 167.
  Canada, Glassford, 89. Skinner & M'Culloch, 88, 90.
  Ceylon. Denmark, Andersen, 15. *Egypt*, 169–174.
  France, Batailler, 412. Bodin, 426. Jerome, Brothers, 549. Lebert, 569. Mittelette, 1661. Moysen, 467. Schneider & Legrand, 1001. Vachon & Co., 705.
  India, VI. IX.
  Netherlands, Cazaux, 89. Hesselink, 66. Jenken, 74.
  Portugal, 632. *Switzerland*, Chollet, 70.
  United States, Allen & Co., 97. Emory & Co., 148. Gates, 423. Gating, 162. Hussey, 65. McCormick, 73. Smith, 86. Wells, 107.
  Western Africa, Jamieson, 22.
  Zollverein (1), Sprengel & Co., 67. Stolle, 65. (6), Hesse-Darmstadt Board of Agriculture, 13.

INDEX OF EXHIBITORS AND OTHERS

WHOSE NAMES APPEAR IN THE CATALOGUE.

Memorandum.—This Index includes the name of every Person, and Public or other Company, mentioned in the Catalogue, whether as Contributor, Manufacturer, Patentee, Agent, or in any way connected with Articles in the Exhibition. The references following each name distinguish—1. Class in the United Kingdom, the Colony, or Foreign Country in which the same will be found; and 2. The number in the Catalogue borne by the entry to which the name is prefixed.

INTRODUCTION.

The activity of the present day chiefly develops itself in commercial industry, and it is in accordance with the spirit of the age that the nations of the world have now collected together their choicest productions. It may be said without presumption, that an event like this Exhibition could not have taken place at any earlier period, and perhaps not among any other people than ourselves. The friendly confidence reposed by other nations in our institutions; the perfect security for property; the commercial freedom, and the facility of transport, which England pre-eminently possesses, may all be brought forward as causes which have operated in establishing the Exhibition in London. Great Britain offers a hospitable invitation to all the nations of the world, to collect and display the choicest fruits of their industry in her Capital; and the invitation is freely accepted by every civilized people, because the interest both of the guest and host is felt to be reciprocal.

But the consideration of the wide moral agencies which have contributed to produce the present Exhibition must be postponed, and we proceed at once to trace the course of the more direct influences which have lead to its establishment.

Fairs, which are one sort of exhibitions of works of industry, have been established for centuries, in every part of the United Kingdom; but exhibitions resembling the present institution, in which the race is for excellence, and direct commerce is not the primary object, have taken place only during the last century, and have been originated by individuals, or societies, independently of any Government assistance. As early as the years 1756-7 the Society of Arts of London offered prizes for specimens of manufactures, tapestry, carpets, porcelain, &c., and exhibited the works which were offered in competition. About the same period, the Royal Academy, as a private society, patronized by the Sovereign, more in a personal capacity than as representing the head of the Legislature, had organized its exhibitions of painting, sculpture, and engraving.

The first exhibition of industrial productions in France, recognised as a national institution, occurred in 1798, a second took place in 1801, a third in 1802, and a fourth in 1806. But it was not until the year 1819, that the expositions of French industry have taken place systematically; and it is only since that time that the influence of them has been markedly felt in Europe.

Local Exhibitions in United Kingdom.

During the last thirty years, in each of the metropolitan cities of the United Kingdom, and the most important manufacturing towns, one or more exhibitions of machinery and manufactures have been held; and it may be recorded that, as early as 1829, the Royal Dublin Society had founded an exhibition of works of art, science, and manufacture, to be held triennially, to which, however, Irish productions only were admitted until the year 1850. But the local exhibition of Birmingham, held in the autumn of the year 1849—originating with individuals, self-supporting in its management, and comprehensive in the scope of the objects exhibited—may be said to have most nearly resembled the Exhibition of the present year. All similar exhibitions, in fact, have been essentially of a private and local character, none of them receiving any kind of Government or national sanction, if we except the exhibition of manufactures applicable to the decoration of the Houses of Parliament, which was instituted by the Fine Arts Commissioners.

To follow the links of the chain which have connected the present Exhibition with the national sympathies and support, we must revert to the French exposition in 1844. The great success of that exposition caused several representations to be made to members of the Cabinet, of the benefit which a similar exhibition would be likely to confer on the industry of the United Kingdom, and some efforts were made to obtain the assistance of the Government, but with no apparent results. No hopes whatever were held out that the Government would undertake any pecuniary liabilities in promoting such an exhibition. It may be mentioned that, even so late as the year 1848, a proposal to establish a self-supporting exhibition of British industry, to be controlled by a Royal Commission, was submitted to His Royal Highness the Prince Albert, and by him laid before the Government; still the Government hesitated to take up the subject, and it became quite evident to those parties who were most desirous of witnessing the establishment of a national exhibition, that if such an event should ever take place, it would have to be carried out independently of any Government assistance.

It is a marking feature in all the institutions and great works of our country, that they are the consequences of popular wishes. It is not until wants become national, and that combined action becomes essential to success, that the people seek the aid of the Government. The great constitutional freedom which this country enjoys, may be ascribed in some measure to the reluctance which the Government always shows to act on behalf of the people in any case where it is possible they can act for themselves. A great part of the success which has attended the institution of this Exhibition, may be attributed to its independence of the Government; and it may be the boast of our countrymen that the Exhibition was originated, conducted, and completed independently of any Government aid whatever, except its sanction. Assistance has only been sought from the Government when it was indispensable, as in correspondence with foreign countries, the provision of a site for the building, the organization of police, &c.; and wherever such assistance, when granted, would have entailed expense, the cost of it has been defrayed from the funds of the Exhibition.

Step by step, the subject of a national exhibition, and the means of realizing it, became connected with the Society of Arts. In June, 1845, a committee of members of that Society was formed to carry out an exhibition of national industry, and funds were subscribed by the individuals forming the committee to meet the preliminary expenses. An inquiry was set on foot to ascertain the disposition of manufacturers to support the exhibition, but the attempt failed and was abandoned. In 1847 the Council of the Society substituted action for theory, and, in the midst of discouragement, established a limited exhibition of manufactures, professedly as the beginning of a series.

The success of this exhibition determined the Council to persevere, and to hold similar exhibitions annually. Accordingly in the next year the experiment was repeated with such greatly increased success, that the Council felt warranted in announcing their intention of holding annual exhibitions, as a means of establishing a quinquennial Exhibition of British Industry, to be held in 1851. Having proceeded thus far, the Council sought to connect the Schools of Design, located in the centres of manufacturing industry, with the proposed exhibitions, and obtained the promised co-operation of the Board of Trade, through the President, Mr. LABOUCHERE; moreover, with a view to prepare a suitable building, they secured the promise of a site from the Earl of CARLISLE, then Chief Commissioner of Woods and Forests, who offered either the central area of Somerset House, or some other Government ground. In the year 1849 the exhibition, still more successful than any preceding, consisted chiefly of works in the precious metals, some of which were graciously contributed by HER MAJESTY. To aid in carrying out their intention of holding a National Exhibition in the year 1851, the Council of the Society caused a report on the French Exposition, held in 1849, to be made for them and printed. A petition was also presented by the Council to the House of Commons, praying that they might have the use of some public building for the exhibition of 1851, which was referred to the Select Committee on the School of Design.

Enlarged by Prince Albert.

HIS ROYAL HIGHNESS THE PRINCE ALBERT, as President of the Society, had of course been fully informed, from time to time, of all these proceedings, which had received His Royal Highness's sanction and approval; but immediately after the termination of the session of 1849, the Prince took the subject under his own personal superintendence. He proceeded to settle the general principles on which the proposed exhibition for 1851 should be conducted, and to consider the mode in which it should be carried out.

His Royal Highness's views.

His Royal Highness has himself fully expressed the views which prompted him to take the lead in carrying out the Exhibition, and on the occasion of the banquet to promote the Exhibition, given by Mr. FARNCOMB, the Lord Mayor of London, to the municipal authorities of the United Kingdom, His Royal Highness declared these views in the following terms:—

> It must, indeed, be most gratifying to me, to find that a suggestion which I had thrown out, as appearing to me of importance at this time, should have met with such universal concurrence and approbation; for this has proved to me that the view I took of the peculiar character and requirements of our age was in accordance with the feelings and opinions of the country. Gentlemen, I conceive it to be the duty of every educated person closely to watch and study the time in which he lives; and, as far as in him lies, to add his humble mite of individual exertion to further the accomplishment of what he believes Providence to have ordained. Nobody, however, who has paid any attention to the particular features of our present era, will doubt for a moment that we are living at a period of most wonderful transition, which tends rapidly to the accomplishment of that great end to which, indeed, all history points—the realization of the unity of mankind. Not a unity which breaks down the limits, and levels the peculiar characteristics of the different nations of the earth, but rather a unity the result and product of those very national varieties and antagonistic qualities. The distances which separated the different nations and parts of the globe are gradually vanishing before the achievements of modern invention, and we can traverse them with incredible ease; the languages of all nations are known, and their acquirements placed within the reach of everybody; thought is communicated with the rapidity and even by the power of lightning. On the other hand, the great principle of division of labour, which may

be called *the moving power of civilization*, is being extended to all branches of science, industry, and art. Whilst formerly the greatest mental energies strove at universal knowledge, and that knowledge was confined to the few, now they are directed to specialties, and in these again even to the minutest points; but the knowledge acquired becomes at once the property of the community at large. Whilst formerly discovery was wrapt in secresy, the publicity of the present day causes that no sooner is a discovery or invention made, than it is already improved upon and surpassed by competing efforts; the products of all quarters of the globe are placed at our disposal, and we have only to choose which is the best and cheapest for our purposes, and the powers of production are intrusted to the stimulus of competition and capital. So man is approaching a more complete fulfilment of that great and sacred mission which he has to perform in this world. His reason being created after the image of God, he has to use it to discover the laws by which the Almighty governs his creation, and, by making these laws his standard of action, to conquer Nature to his use—himself a divine instrument. Science discovers these laws of power, motion, and transformation: industry applies them to the raw matter, which the earth yields us in abundance, but which becomes valuable only by knowledge: art teaches us the immutable laws of beauty and symmetry, and gives to our productions forms in accordance with them. Gentlemen,—THE EXHIBITION of 1851 is to give us a true test and a living picture of the point of development at which the whole of mankind has arrived in this great task, and a new starting-point from which all nations will be able to direct their further exertions. I confidently hope the first impression which the view of this vast collection will produce upon the spectator will be that of deep thankfulness to the Almighty for the blessings which He has bestowed upon us already here below; and the second, the conviction that they can only be realized in proportion to the help which we are prepared to render to each other—therefore, only by peace, love, and ready assistance, not only between individuals, but between the nations of the earth.

Meeting at Buckingham Palace.

On the 29th June, 1849, the general outlines of the Exhibition were discussed by His Royal Highness; and from that day to the present time, accurate accounts of all proceedings have been kept, and the greater part of them printed and published The minutes of a meeting of several members of the Society of Arts, held at Buckingham Palace on the 30th June, set forth as follows:—

His Royal Highness communicated his views regarding the formation of a Great Collection of Works of Industry and Art in London in 1851, for the purposes of exhibition, and of competition and encouragement.

His Royal Highness considered that such Collection and Exhibition should consist of the following divisions:—

Raw Materials.
Machinery and Mechanical Inventions.
Manufactures.
Sculpture and Plastic Art generally.

It was a matter of consideration whether such divisions should be made subjects of simultaneous exhibition, or be taken separately. It was ultimately settled that, on the first occasion at least, they should be simultaneous.

Various sites were suggested as most suitable for the building; which it was settled must be, on the first occasion at least, a temporary one. The Government had offered the area of Somerset House; or if that were unfit, a more suitable site on the property of the Crown. His Royal Highness pointed out the vacant ground in Hyde Park on the south side, parallel with, and between, the Kensington drive and the ride commonly called Rotten Row, as affording advantages which few other places might be found to possess. Application for this site could be made to the Crown.

It was a question whether this Exhibition should be exclusively limited to British industry. It was considered that, whilst it appears an error to fix any limitation to the productions of machinery, science, and taste, which are of no country, but belong, as a whole, to the civilized world, particular advantage to British industry might be derived from placing it in fair competition with that of other nations.

It was further settled that, by offering very large premiums in money, sufficient inducement would be held out to the various manufacturers to produce works which, although they might not form a manufacture profitable in the general market, would, by the effort necessary for their accomplishment, permanently raise the powers of production, and improve the character of the manufacture itself.

It was settled that the best mode of carrying out the execution of these plans would be by means of a Royal Commission, of which His Royal Highness would be at the head. His Royal Highness proposed that inasmuch as the home trade of the country will be encouraged, as many questions regarding the introduction of foreign productions may arise,—in so far also as the Crown property may be affected, and Colonial products imported,—the Secretaries of State, the Chief Commissioner of Woods, and the President of the Board of Trade, should be ex-officio members of this Commission; and for the execution of its details some of the parties present, who are also members or officers of the Society of Arts, and who have been most active in originating and preparing for the execution of this plan, should be suggested as members, and that the various interests of the community also should be fully represented therein.

It was settled that a draft of the proposed Commission, grounded on precedents of other Royal Commissions, be prepared, and that information regarding the most expeditious and direct mode of doing this be procured, and privately submitted to Her Majesty's Government, in order that no time be lost in preparation for the collection when the authority of the Government shall have been obtained.

It was settled that a subscription for donations on a large scale, to carry this object into effect, would have to be organized immediately. It was suggested that the Society for Encouragement of Arts under its charter possessed machinery and an organization which might be useful, both in receiving and holding the money, and in assisting the working out of the Exposition.—(*Minutes of the Meeting on the* 30*th of June*, 1849, *at Buckingham Palace.*)

The minutes of a second meeting held on the 14th July, at Osborne, are as follows:— **Meeting at Osborne.**

His Royal Highness stated that he had recently communicated his views regarding the formation of a great collection of works of industry and art in London in 1851, for the purpose of exhibition, and of competition and encouragement, to some of the leading statesmen, and amongst them to Sir ROBERT PEEL.

His Royal Highness judged, as the result of these communications, that the importance of the subject was fully appreciated, but that its great magnitude would necessarily require some time for maturing the plans essential to secure its complete success.

His Royal Highness communicated that he had also requested Mr. LABOUCHERE, as President of the Board of Trade, to give his consideration to this subject. Mr. LABOUCHERE was now at Osborne, and His Royal Highness expressed his desire that he should be present at this meeting. Mr. LABOUCHERE was accordingly invited to be present.

His Royal Highness gave it as his opinion that it was most important that the co-operation of the Government and sanction of the Crown should be obtained for the undertaking; but that it ought to be matter for serious consideration how that co-operation and sanction could be most expediently given.

Mr. LABOUCHERE stated that the whole subject would have the very best consideration he could give it; and on behalf of the Ministry, he could promise an early decision as to the manner in which they could best give their co-operation.

He suggested that if, instead of a Royal Commission being formed, to include some of the chief members of Her Majesty's Government, those same Ministers were to be elected members of a Managing Committee of the Society of Arts, this object might perhaps be as well accomplished.

It was explained to Mr. LABOUCHERE that the exertions of the Society of Arts would be given to the undertaking, to the utmost extent to which they could be useful; but that these functions would necessarily be of an executive and financial nature, rather than of a judicial and legislative character.

It was further urged by the three members of the Society, that one of the requisite conditions for the acquirement of public confidence was, that the body to be appointed for the exercise of those functions should have a sufficiently elevated position in the eyes of the public, and should be removed sufficiently high above the interests, and remote from the liability of being influenced by the feelings of competitors, to place beyond all possibility any accusation of partiality or undue influence; and that no less elevated tribunal than one appointed by the Crown, and presided over by His Royal Highness, could have that standing and weight in the country, and give that guarantee for impartiality that would command the utmost exertions of all the most eminent manufacturers at home, and particularly abroad: moreover, that the most decided mark of *national* sanction must be given to this undertaking, in order to give it the confidence, not only of all classes of our own countrymen, but also of foreigners accustomed to the expositions of their own countries, which are conducted and supported exclusively by their Governments.

It was also stated that, under such a sanction, and with such plans as now proposed, responsible parties would, it was believed and could be proved, be found ready to place at the disposal of the Commission sufficient funds to cover all preliminary expenses and the risks incidental to so great an undertaking.

Mr. LABOUCHERE expressed his sense of the great national importance of the proposal, and wished such further communication on the subject as might enable him fully to understand it, to be able better to consider the matter with his colleagues in the Cabinet.

Plan of operations.

At the same time a general outline of a plan of operations was submitted:—

I. A ROYAL COMMISSION.—For promoting Arts, Manufactures, and Industry, by means of a great Collection of Works of Art and Industry of All Nations, to be formed in London, and exhibited in 1851. President, HIS ROYAL HIGHNESS PRINCE ALBERT.

1. The duties and powers of the Commission to extend to the determination of the nature of the prizes, and the selection of the subjects for which they are to be offered.
2. The definition of the nature of the Exhibition, and the best manner of conducting all its proceedings.
3. The determination of the method of deciding the prizes, and the responsibility of the decision.

II. THE SOCIETY OF ARTS.—To organize the means of raising funds to be placed at the disposal of the Commission for Prizes, and to collect the funds and contributions to provide a building and defray the necessary expenses to cover the risks of the collection and exhibition; and to provide for the permanent establishment of these Quinquennial Exhibitions.

The prizes proposed to be submitted for the consideration of the Commission to be medals, with money prizes so large as to overcome the scruples and prejudices even of the largest and richest manufacturers, and ensure the greatest amount of exertion. It was proposed that the first prize should be £5,000, and that one, at least of £1,000, should be given in each of the four sections. Medals conferred by the Queen would very much enhance the value of the prizes.

Mr. LABOUCHERE finally stated that the whole matter should be carefully considered; but that there was no use in bringing it before the Cabinet at the moment of a closing session—that the Cabinet would now disperse, and not meet again till the autumn. The interval from now to October or November might be most usefully employed by the Society in collecting more detailed evidence as to the readiness of the great manufacturing and commercial interests to subscribe to and support the undertaking, and he promised to employ that interval in further informing himself, and endeavouring to ascertain the general feeling of the country on the subject.—(*Minutes of the Meeting on the 14th of July, 1849, at Osborne.*)

The Prince's letter to the Home Secretary.

On the 31st July, 1849, His Royal Highness addressed a letter to the Home Secretary, in order to bring the subject officially to the notice of Her Majesty's Government.

SIR, *Osborne, July* 31, 1849.

THE Society of Arts having during several years formed exhibitions of works of national industry, which have been very successful, believe that they have thereby acquired sufficient experience, and have sufficiently prepared the public mind, to venture upon the execution of a plan they have long cherished—to invite a Quinquennial Exhibition in London of the Industry of All Nations.

They think that the only condition wanting to ensure the success of such an undertaking, would be the sanction of the Crown, given in a conspicuous manner; and they are of opinion that no more efficacious mode could be adopted than the issue of a Royal Commission to inquire into, and report upon, the practicability of the scheme, and the best mode of executing it.

I have therefore been asked, as President of the Society, to bring this matter officially before you, and to beg that Her Majesty's Government will give this subject their best consideration.

The Exhibition was proposed to be invited for 1851, and the magnitude of the necessary preliminary arrangements renders it highly desirable that the decision which the Government may have come to should be ascertained within the space of a few months.

I have, &c.,

(Signed) ALBERT.

The Right Honourable
Sir George Grey, Bart., G.C.B.,
&c. &c. &c.

SIR, *Whitehall, August 1st*, 1849.

I HAVE had the honour to receive your Royal Highness's letter of the 31st July, suggesting the issue of a Royal Commission to inquire into, and report upon, the practicability of a scheme which has been formed by the Society of Arts for a Quinquennial Exhibition in London of the Industry of all Nations.

I shall not fail, in obedience to your Royal Highness's command, to take an early opportunity of bringing this important subject under the consideration of Her Majesty's Government, and I am confident that it will receive their careful and deliberate attention.

I have, &c.,

(Signed) G. GREY.

To His Royal Highness Prince Albert, K.G.

(*Minutes of the Meeting on the 3rd of September*, 1849, *at Balmoral.*)

In this stage of the proceeding it became necessary to place the accomplishment of the undertaking, as far as possible, beyond a doubt. Having acquired experience, in 1845, of the difficulties to be encountered, the Council of the Society of Arts felt that the proposal must not be brought a second time before the public as an hypothesis, but that the only means of succeeding was to prove that they had both the will and the power to carry out the Exhibition. The Society had no funds of its own available for the advances necessary to be made. The outlay for a building upon the scale then thought of, and for preliminary expenses, was estimated at the least at £70,000.

After much fruitless negotiation with several builders and contractors, an agreement was made between the Society of Arts and the Messrs. MUNDAY, by which the latter undertook to deposit £20,000 as a prize fund, to erect a suitable building, to find offices, to advance the money requisite for all preliminary expenses, and to take the whole risk of loss on certain conditions. It was proposed that the receipts arising from the Exhibition should be dealt with as follows:—The £20,000 prize fund, the cost of the building, and five per cent. on all advances, were to be repaid in the first instance: the residue was then to be divided into three equal parts; one part was to be paid at once to the Society of Arts as a fund for future exhibitions; out of the other two parts all other incidental costs, such as those of general management, preliminary expenses, &c., were to be paid; and the residue, if any, was to be the remuneration of the contractors, for their outlay, trouble, and risk. Subsequently the contractors agreed that instead of this division they would be content to receive such part of the surplus, if any, as, after payment of all expenses, might be awarded by arbitration. This contract was made on 23rd August, 1849, but the deeds were not signed until the 7th November following.

For the purpose of carrying the contract into execution on behalf of the Society, the Council nominated an Executive Committee of four members, who were afterwards appointed the Executive in the Royal Commission, and the contractors their own nominee. In thus making the contract with private parties for the execution of what, in fact, would become a national object, if the proposal should be entertained by the public, every care was taken to anticipate the public wishes, and to provide for the public interests. It was foreseen that if the public identified itself with the Exhibition, they would certainly prefer not to be indebted to private enterprise and capital for carrying it out. A provision was made with the contractors to meet this probability, by which it was agreed, that if the Treasury were willing to take the place of the contractors, and pay the liabilities incurred, the Society of Arts should have the power of determining the contract before the 1st February, 1850. In the event of an exercise of this power the compensation to be paid to the Messrs. MUNDAY for their outlay and the risk was to be settled by arbitration.

The Society of Arts having thus secured the performance of the pecuniary part of the undertaking, the next step taken was to ascertain the readiness of the public to promote the Exhibition. It has been shown that the proof of this readiness would materially influence Her Majesty's Government in consenting to the proposal to issue a Royal Commission to superintend the Exhibition. The Prince ALBERT, as President of the Society of Arts, therefore commissioned several members of the Society, in the autumn of 1849, to proceed to the "manufacturing districts of the country, in order to collect the opinions of the leading manufacturers, and further evidence with reference to a Great Exhibition of the Industry of all Nations to be held in London in the year 1851, in order that His Royal Highness might bring the results before Her Majesty's Government." Commissioners were appointed, visits made, and reports of the results submitted to the Prince, from which it appeared that 65 places, comprehending the most important cities and towns of the United Kingdom, had been visited. Public meetings had been held, and local committees of assistance formed in them.

Visits to the manufacturing districts.

It further appeared that nearly 5000 influential persons had registered themselves as promoters of the proposed Exhibition.

Royal Commission appointed.

Upon the presentation of these reports to Her Majesty's Government, the Queen was pleased to issue the following Commission, which was published in the London Gazette of 3rd January, 1850:—

VICTORIA, R.

VICTORIA, by the grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith: To Our most dearly-beloved Consort His Royal Highness FRANCIS ALBERT AUGUSTUS CHARLES EMANUEL, Duke of SAXONY, Prince of SAXE-COBURG AND GOTHA, Knight of Our Most Noble Order of the Garter, and Field-Marshal in Our army;—Our right trusty and right entirely well-beloved cousin and Councillor WALTER FRANCIS Duke of BUCCLEUCH AND QUEENSBERRY, Knight of Our Most Noble Order of the Garter; Our right trusty and right well-beloved cousin WILLIAM Earl of ROSSE, Knight of Our Most Illustrious Order of St. Patrick; Our right trusty and right-well beloved cousins and Councillors, GRANVILLE GEORGE Earl GRANVILLE, and FRANCIS Earl of ELLESMERE; Our right trusty and well-beloved Councillor EDWARD GEOFFREY Lord STANLEY; Our right trusty and well-beloved Councillors, JOHN RUSSELL (commonly called Lord JOHN RUSSELL), Sir ROBERT PEEL, Baronet, HENRY LABOUCHERE, and WILLIAM EWART GLADSTONE; Our trusty and well-beloved Sir ARCHIBALD GALLOWAY, Knight Commander of Our Most Honourable Order of the Bath, and Major-General in Our Army in the East Indies, Chairman of the Court of Directors of the East India Company,[*] or the Chairman of the Court of Directors of the East India Company for the time being; Sir RICHARD WESTMACOTT, Knight; Sir CHARLES LYELL, Knight, President of the Geological Society of London, or the President of the Geological Society of London for the time being;[†] THOMAS BARING, Esquire; CHARLES BARRY, Esquire; THOMAS BAZLEY, Esquire; RICHARD COBDEN, Esquire; WILLIAM CUBITT, Esquire, President of the Institution of Civil Engineers, or the President of the Institution of Civil Engineers for the time being; CHARLES LOCK EASTLAKE, Esquire;[‡] THOMAS FIELD GIBSON, Esquire; JOHN GOTT, Esquire; SAMUEL JONES LOYD, Esquire;[§] PHILIP PUSEY, Esquire; and WILLIAM THOMPSON, Esquire, greeting:

WHEREAS the Society for the Promotion of Arts, Manufactures, and Commerce, incorporated by Our Royal Charter, of which Our most dearly-beloved Consort the Prince ALBERT is President, have of late years instituted Annual Exhibitions of the Works of British Art and Industry, and have proposed to establish an enlarged Exhibition of the Works of Industry of all Nations, to be holden in London in the year 1851, at which Prizes and Medals, to the value of at least Twenty Thousand Pounds Sterling, shall be awarded to the Exhibitors of the most meritorious works then brought forward; and have invested in the Names of Our right trusty and entirely beloved cousin SPENCER JOSHUA ALWYNE Marquess of Northampton; Our right trusty and right well-beloved cousin and Councillor GEORGE WILLIAM FREDERICK Earl of CLARENDON, Knight of Our Most Noble Order of the Garter; Our trusty and well-beloved Sir JOHN PETER BOILEAU, Baronet, and JAMES COURTHOPE PEACHE, Esquire, the sum of Twenty Thousand Pounds, to be awarded in Prizes and Medals as aforesaid: and have appointed our trusty and well-beloved ARTHUR KETT BARCLAY, Esquire, WILLIAM COTTON, Esquire, Sir JOHN WILLIAM LUBBOCK, Baronet, SAMUEL MORTON PETO, Esquire, and Baron LIONEL DE ROTHSCHILD, to be the

---

[*] At his death in 1850, he was succeeded by JOHN SHEPHERD, Esq.

[†] Succeeded by WILLIAM HOPKINS, Esquire, M.A., Cambridge, though Sir C. LYELL still remains a Commissioner by election under the Royal Charter afterwards granted.

[‡] Now Sir C. L. EASTLAKE, President of the Royal Academy.

[§] Now Baron OVERSTONE.

Treasurers for all Receipts arising from donations, subscriptions, or any other source on behalf of or towards the said Exhibition; Our trusty and well-beloved PETER LE NEVE FOSTER, JOSEPH PAYNE, and THOMAS WINKWORTH, Esquires, to be the Treasurers for payment of all Executive Expenses; and Our trusty and well-beloved HENRY COLE, CHARLES WENTWORTH DILKE, the younger, GEORGE DREW, FRANCIS FULLER, and ROBERT STEPHENSON, Esquires, with our trusty and well-beloved MATTHEW DIGBY WYATT, Esquire, as their Secretary, to be an Executive Committee for carrying the said Exhibition into effect, under the directions of Our most dearly beloved Consort:

AND whereas the said Society for the Promotion of Arts, Manufactures, and Commerce, have represented unto Us, that in carrying out the objects proposed by the said Exhibition, many questions may arise regarding the introduction of productions into Our kingdom from Our Colonies, and from Foreign Countries; also regarding the site for the said Exhibition; and the best mode of conducting the said Exhibition; likewise regarding the determination of the nature of the Prizes, and the means of securing the most impartial distribution of them; and have also besought Us that We would be graciously pleased to give Our sanction to this undertaking, in order that it may have the confidence, not only of all classes of Our subjects, but of the subjects of Foreign Countries:

NOW KNOW YOU THAT WE, considering the premises, and earnestly desiring to promote the proposed Exhibition, which is calculated to be of great benefit to Arts, Agriculture, Manufactures, and Commerce, and reposing great trust and confidence in your fidelity, discretion, and integrity, have authorized and appointed, and by these presents do authorize and appoint you, Our most dearly beloved Consort FRANCIS ALBERT EMANUEL Duke of SAXONY, Prince of SAXE-COBOURG AND GOTHA, you WALTER FRANCIS DUKE of BUCCLEUCH AND QUEENSBERRY; WILLIAM Earl of ROSSE; GRANVILLE GEORGE Earl GRANVILLE; FRANCIS Earl of ELLESMERE; EDWARD GEOFFREY Lord STANLEY; JOHN RUSSELL (commonly called Lord JOHN RUSSELL), Sir ROBERT PEEL, HENRY LABOUCHERE, WILLIAM EWART GLADSTONE, Sir ARCHIBALD GALLOWAY, or the Chairman of the Court of Directors of the East India Company for the time being, Sir RICHARD WESTMACOTT, Sir CHARLES LYELL, or the President of the Geological Society for the time being, THOMAS BARING, CHARLES BARRY, THOMAS BAZLEY, RICHARD COBDEN, WILLIAM CUBITT, or the President of the Institution of Civil Engineers for the time being, CHARLES LOCK EASTLAKE, THOMAS FIELD GIBSON, JOHN GOTT, SAMUEL JONES LOYD, PHILIP PUSEY, and WILLIAM THOMPSON, to make full and diligent inquiry,—into the best mode by which the productions of Our Colonies and of Foreign Countries may be introduced into Our kingdom;—as respects the most suitable site for the said Exhibition,—the general conduct of the said Exhibition;—and also into the best mode of determining the nature of the Prizes, and of securing the most impartial distribution of them:

AND to the end that Our Royal Will and Pleasure in the said inquiry may be duly prosecuted, and with expedition, WE FURTHER, BY THESE PRESENTS, WILL AND COMMAND, and do hereby give full power and authority to you, or any three or more of you, to nominate and appoint such several persons of ability as you may think fit to be Local Commissioners, in such parts of Our kingdom and in Foreign parts as you may think fit, to aid you in the premises; which said Local Commissioners, or any of them, shall and may be removed by you, or any three or more of you, from time to time, at your will and pleasure, full power and authority being hereby given to you, or any three or more of you, to appoint others in their places respectively.

AND FURTHERMORE, We do, by these Presents, give and grant to you, or any three or more of you, full power and authority to call before you, or any three or more of you, all such persons as you shall judge necessary, by whom you may be the better informed of the truth of the premises, and to inquire of the premises, and every part thereof, by all other lawful ways and means whatsoever.

AND OUR FURTHER WILL AND PLEASURE IS, That for the purpose of aiding you in the execution of these premises, We hereby appoint Our trusty and well-beloved JOHN SCOTT

RUSSELL and STAFFORD HENRY NORTHCOTE,* Esquires, to be joint Secretaries to this Our Commission.

AND for carrying into effect what you shall direct to be done in respect of the said Exhibition, We hereby appoint the said HENRY COLE, CHARLES WENTWORTH DILKE the younger, GEORGE DREW, FRANCIS FULLER, and ROBERT STEPHENSON, to be the Executive Committee in the premises, and MATTHEW DIGBY WYATT to be the Secretary of the said Executive Committee.

AND OUR FURTHER WILL AND PLEASURE IS, That you, or any three or more of you, when and so often as need or occasion shall require, so long as this Our Commission shall continue in force, do report to Us in writing, under your hands and seals respectively, all and every of the several proceedings of yourselves had by virtue of these presents, together with such other matters, if any, as may be deserving of Our Royal consideration touching or concerning the premises.

AND LASTLY, WE DO BY THESE PRESENTS ORDAIN, That this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, shall and may, from time to time, and at any place or places, proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

Given at Our Court at St. James's, the 3rd day of January,
in the 13th year of Our reign.

By Her Majesty's Command,
G. GREY.

Determination of the Contract with the Society of Arts.

The foresight of the Society of Arts, which had provided a mode by which the contract might be determined in conformity with the public wishes, was fully justified by the event. So far as the public manifested its opinion it appeared to be its wish that the undertaking should be carried out as a national work. Accordingly, at the first meeting of the Commissioners, held on 11th January, 1850, the propriety of confirming the contract was discussed, and they resolved to avail themselves of the powers which the Council of the Society of Arts had reserved. The first act of the Commissioners was the publication of the following announcement:—

The Royal Commissioners have felt it their duty, at this their first meeting, to take into their immediate consideration the propriety of confirming the Contract which has been entered into with Messrs. MUNDAY.

They are perfectly satisfied that the contract was framed with the sole desire on the part of the Society of Arts of promoting the objects of the Commission,—that in agreeing to it at a time when the success of the scheme was necessarily still doubtful, the Messrs. MUNDAY evinced a most liberal spirit,—that it has hitherto afforded the means of defraying all the preliminary expenses,—and that its conditions are strictly reasonable, and even favourable to the public.

After hearing, however, the statements made by individual members of the Commission,—after communicating with the Executive Committee,—and after a full consideration of the whole subject,—the Commissioners have come to the conclusion that it will be more consonant with the public feeling, and therefore more conducive to the objects for which the Commission has been appointed, to exercise the power reserved, and at once and absolutely to terminate the contract with the Messrs. MUNDAY.

This determination necessarily throws the whole burden of the Exhibition upon voluntary contributions. The experiment is of a national character, and the Commissioners feel that it ought to rest for its support upon national sympathies, and upon such liberal contributions as those sympathies may dictate.

---

* Now Sir STAFFORD H. NORTHCOTE, Bart.

> The amount of the funds which the public may place at the disposal of the Commissioners must determine the extent of accommodation which can be provided for the Exhibitors, and the terms on which admission can be given to the articles to be exhibited, and upon which also the public can be admitted to inspect them.
>
> The Commissioners wish it to be understood that they are invested with unrestricted power over the application of the funds; that it is their intention to invite competition in respect of all branches of expenditure to which competition can advantageously be applied; and that they will proceed, without delay, to establish regulations for insuring an effectual control over the expenditure, and a satisfactory audit of the accounts.
>
> The Commissioners feel, that in thus abandoning a contract which, regarded in a pecuniary point of view alone, is undoubtedly advantageous to the public, and resting the success of the proposed experiment entirely upon public sympathy, they have adopted a course in harmony with the general feelings of the community.
>
> It now rests with the public to determine, by the amount of their contributions, the character of the proposed Exhibition, and the extent of benefit to industry in all its branches which will result from it.
>
> It is desirable that subscriptions for this great purpose be immediately commenced throughout the United Kingdom, and the result ascertained with the least possible delay.
>
> In the mean time the Commissioners will be actively engaged in preparing the various measures, upon which it will be their duty to come to a final decision as soon as they are enabled definitely to ascertain the extent of the pecuniary means which will be placed at their disposal.

It is desirable, before giving any account of the proceedings under the Commission, to notice those changes which necessarily supervened upon the determination of the contract. The Commission itself set forth that the functions of the Commissioners were those of inquiry and general direction, whilst all the pecuniary responsibilities, and the performance of all the executive duties, were to be carried out by and in the name of the Society of Arts; but when the contract was cancelled, although the Commission itself was not altered, the practical result was to place on the Commissioners individually and personally the whole responsibility of the undertaking, both pecuniary and executive. Under these circumstances the Executive Committee felt it to be their duty to tender their resignations (*Min.* iv., p. 3), which they did in the following terms:—

> The members of the Executive Committee submit that the dissolution by the Royal Commission of the contract, which they had been appointed for the purpose of carrying out, has changed the nature of their functions, and even superseded many of them. They are of opinion, therefore, that it is desirable that the Royal Commission should be left as free to select the best organization for carrying their intentions into effect, as if the Executive Committee had never been appointed. They feel that they should not be acting in accordance with their sincere wishes of witnessing the perfect success of the Exhibition, if they did not come forward to express their entire readiness at once to place their position in the hands of HIS ROYAL HIGHNESS THE PRINCE ALBERT, and the Royal Commissioners.

These resignations were not accepted, and some time elapsed before the executive arrangements were conclusively modified to meet the altered circumstances of the case. It had been the original intention of the Society of Arts in forming the contract, that in the event of its being determined, the liabilities of the contractors should be simply transferred to the Government, and that the original relations between the Commissioners and the Society of Arts should have remained; but this intention does not seem to have been made sufficiently clear by the deed, and it was not urged by the Society of Arts. The deed of contract simply provided that the Treasury should have power to undertake the liabilities and relieve the Society of Arts from them. This the Treasury did, but in doing so, at the same time took a guarantee from the Commissioners themselves, and thus the whole responsibilities rested with them. The answer of the Treasury to the Commissioners was that—

Mutual liabilities of the Treasury and the Commissioners.

> My Lords have no intention of rendering themselves liable to the payment of any sum on this account; but as it seems that a request from them, that the contract should be determined, is necessary in order to enable the Commissioners to carry out their own intentions, they have no objection to taking the formal step of making the request suggested by the Commissioners to the Council of the Society of Arts, on receiving from the Commissioners an undertaking that the money will be forthcoming when required by Messrs. MUNDAY in conformity with the stipulations of the contract.

The Commissioners accordingly undertook that the money should be forthcoming when required (*Min.* iii., p 7). The Society of Arts gave the requisite notices to the Messrs. MUNDAY, and in due time all the outlay which they had made, amounting to about £23,000, with the interest which had accrued, was repaid to them.

The pecuniary liabilities having thus devolved wholly on the Commissioners, it became natural that they should desire to appoint a chief executive officer of their own nomination. HER MAJESTY was advised to issue supplemental commissions, appointing Mr. ROBERT STEPHENSON, M.P., a Commissioner, upon his resignation as Chairman of the Executive Committee, and Lieutenant-Colonel W. REID, R.E., Chairman of the Executive Committee in his place. These appointments were made by the advice of the Government, Mr. LABOUCHERE stating, "that the subject of the executive arrangements had been under their consideration, and that they had proposed to recommend to HER MAJESTY to appoint Colonel REID to be Chairman of the Executive Committee" (*Min.* v., p. 1). The contractors themselves, as well as their nominee, thereupon ceased to attend the meetings of the Executive Committee.

Public Subscriptions and financial management.

The earliest step which the Commissioners took after the determination of the contract was to appeal to the country for subscriptions to carry out the Exhibition. They announced that they had undertaken the absolute control over the expenditure of all money that might come into the hands of their Treasurers, and had made arrangements for auditing accounts, and ensuring the strictest economy. It was pointed out that the scale upon which this important undertaking would be conducted must depend entirely on the amount of pecuniary support which it should receive from the public. The Commissioners appealed with confidence to all classes of the community, to enable them to make such liberal arrangements as would ensure the success of the undertaking in a manner worthy of the character and position of this country, and of the invitation which had been given to the other nations of the world to compete with us in a spirit of generous and friendly emulation. It was announced that the amount of the funds which the public might place at the disposal of the Commissioners must determine the extent of accommodation which could be provided for the Exhibition; and that should any surplus remain, after giving every facility to the exhibitors, and increasing the privileges of the public as spectators, Her Majesty's Commissioners intended to apply the same to purposes strictly in connection with the ends of the Exhibition, or for the establishment of similar exhibitions for the future.

All subscriptions were considered to be absolute and definite; they were paid to the Treasurers of Local Committees, and by them transferred to the general fund at the Bank of England, in the names of the Treasurers named in the Royal Commission. An Appendix to this introduction shows that the *gross* amount of subscriptions reported as having been received has amounted to £75,000. Of this above £64,000 has been paid to the Commissioners, the balance having been reserved by the Local Committees to meet their expenses of collection, printing, &c. The general financial position of the undertaking at the opening of the Exhibition was as follows:—

Receipts.		Revised to October.	*Expenditure and Liabilities.*		Revised to October.
Subscriptions paid to April 22	£64,344	£67,579	Building . . .	£79,800	
For privilege to print the Catalogues	3,200	3,200	Extra Galleries, Counters, and the fittings, estimated at .	35,000	124,452
For privilege to sell Refreshments	5,500	5,500	By Prize Fund	20,000	25,000
By Season Tickets to April 29	40,000	67,610	Management, including Printing and all Incidental Expenses incurred up to April	20,943	20,943
Admissions of the Public .		356,808	Management since, including award to Messrs. Munday, Police, Removals, Gratuities, &c.		120,000
Royalty on sale of 1*s.* Catalogue					
Sundries		4,598			
		505,295			

Subject to the approval of the Commissioners the direct control over this expenditure has been exercised by a Finance Committee, consisting of Lord GRANVILLE (Chairman), Lord OVERSTONE, Mr. LABOUCHERE, Mr. GLADSTONE, Sir ALEXANDER SPEARMAN, Mr. T. F. GIBSON, Mr. T. BARING, Mr. COBDEN, and Mr. PETO. Mr. EDGAR A. BOWRING has acted as Secretary to the Committee, and Assistant Commissary-General CARPENTER, as the financial officer, has administered the actual expenditure of the Commission.

The preceding statement of account shows that, even at the present time, a considerable liability has been incurred by the Commissioners. At the period when it became necessary to make positive arrangements for the erection of the building, the actual receipts were only £35,000: personal responsibility legally attached to His Royal Highness the President, and to every member of the Royal Commission, in respect of every pecuniary engagement. A remedy for this somewhat anomalous position was obtained by means of a charter of incorporation, and the formation of a guarantee fund. The first relieved the Commissioners of all personal responsibility, and the second insured both the completion of the undertaking, and the House of Commons from the liability of being required to make any grant of the national funds towards it.

Charter of Incorporation.

Letters Patent, dated July, 1850, were issued, incorporating the Commissioners, under the title of "The Commissioners for the Exhibition of 1851," and the charter was accepted 15th August, 1850 (*Min.* xxviii., p. 1). A guarantee fund of £230,000 was formed by a limited number of persons, including most of the Commissioners, and other friends of the Exhibition, one of whom opened the list with a subscription of £50,000: upon the security of this fund the Bank of England consented to make such advances of money as might be wanted from time to time.

General principles of the Exhibition.

The fundamental principles upon which it was proposed the Exhibition should

(2) اختار الشيخ الامام ابوبكر محمد بن حامد انها تسعون سنة لان الغالب في اعمار
اهل زماننا و هذا لا يصح الا ان يقال ان الغالب في الا عمار الطوال في اهل زماننا ان لا
يزيد على ذلك نعم المتاخرون الذين اختار واستثنين نبوه علي الغالب من الا عمار
والحاصل ان الاختلاف ما جاء الامن اختلاف الراے في ان الغالب هذا في المطول

admitted, and classified lists of objects were prepared by Committees of eminent persons in each department (whose names are given in an Appendix), and published to show the nature of the contributions which exhibitors were invited to send in the four departments of RAW MATERIALS and PRODUCE, MACHINERY, MANUFACTURES, and FINE ARTS. The regulations by which certain articles were excluded were as follows:—

> Nothing is suitable for the Exhibition, except such results of human industry as are capable of being preserved without injury during many months.
>
> All spirits, wines, and fermented liquors, unless derived from unusual sources, are inadmissible, except in special cases, and under special restrictions; and when oils, spirits, &c., are exhibited, to prevent accidents, they must be shown in well-secured glass vessels.
>
> All highly-inflammable articles, such as gunpowder, detonating powder, lucifer matches, &c., and all live stock, and articles perishable within the duration of the Exhibition, are inadmissible, unless specially excepted.

In respect of the fourth section of the Exhibition, SCULPTURE, MODELS, and the PLASTIC ART, the following were the limitations:—

> Objects formed in any kind of material, if they exhibit such a degree of taste and skill as to come under the denomination of *Fine Art*, may be admitted into this section.
>
> The specimens exhibited shall be works of living artists, or works of artists deceased within three years before the 1st of January, 1850.
>
> Oil paintings and water-colour paintings, frescoes, drawings, and engravings, are not to be admitted, except as illustrations or examples of materials and processes; and portrait busts are not to be admitted.
>
> No single artist will be allowed to exhibit more than three works.

Opening fixed for May 1, 1851.

It was also announced that the 1st day of May, 1851, was fixed for opening the Exhibition, and the engagement has been kept: that Her Majesty had been graciously pleased to grant a site for the Exhibition on the south side of Hyde Park, lying between the Kensington Drive and the Ride commonly called Rotten Row, and that exhibitors would be required to deliver their objects, at their own charge and risk, at the building, which would be provided to them free from rent.

After much examination and inquiry, the Commissioners resolved that prices were not to be affixed to the articles exhibited, although the articles might be marked as shown for economy of production, and the price stated in an invoice to be sent to the Commissioners for the information of the Juries.

Admission of Foreign articles.

It was clear that two very different systems of management would necessarily have to be adopted towards Foreign countries and the United Kingdom, arising out of the different relations of guest and host. Although it was proposed that the expenses of the building and management should be defrayed by voluntary subscriptions, scrupulous care was taken on every occasion to discourage the receipt of any subscription from any foreigner, resident at home or abroad. Over the admission of British articles, the Commissioners reserved to themselves full powers of control; but as respects Foreign articles, the power of admitting them was confided absolutely to an authority of the country which sent them.

In order to give Foreign countries the utmost time for their preparations, and long before the size or character of the building had been determined, the Commissioners resolved to divide a certain large amount of exhibiting space among all Foreign countries, amounting in the whole to above 210,000 superficial feet, or rather more than the entire space which France occupied for its two expositions of 1844 and 1849. It was estimated that this amount would be about half the size of the building, which was considered to be a fair proportion.

Space offered to Foreign countries

The amount of space which was offered to each Foreign country, and placed at its absolute disposal, was as follows:—

	Net superficial Feet allotted.
Arabia	500
Belgium	15,000
Bolivia	100
Brazil	1,000
Buenos Ayres	500
Central America	300
Chili	500
China	2,500
Denmark	2,500
Egypt	1,500
Equator	100
France	50,000
Germany—	
Austria	21,750
Northern Germany—	
States of the Stuerverein	2,250
The Two Mecklenbergs	1,250
Hanse Towns	1,500
Zollverein	30,000
Greece	1,000
Holland	5,000
Italy—	
Naples	2,500
Rome	1,000
Sardinia	1,500
Tuscany	3,750
Mexico	1,000
Monte Video	100
Morocco	500
New Granada	500
Norway and Sweden	2,500
Persia	500
Peru	500
Portugal	1,000
Russia	7,500
Spain	2,500
Switzerland	4,000
Tunis	500
Turkey	5,000
United States	40,000
Venezuela	400
Western Africa	500
Total	213,000

Subsequently these amounts were increased in several instances. France, for example, obtained upwards of 65,000 superficial feet of exhibiting space, instead of only 50,000 feet.

Accompanying the allotment of space sent to each Foreign country and colony, the following instructions were transmitted:—

No articles of foreign manufacture, to whomsoever they may belong, or wheresoever they may be, can be admitted for exhibition, *unless they come with the sanction of the central authority of the country of which they are the produce.* All articles forwarded by such central authority will then be admitted, provided they do not require a greater aggregate amount of space than that assigned to the productions of the country from which they come; and, provided also, that they do not violate the general conditions and limitations. It will rest with the central authority in each country to decide upon the merits of the several articles presented for exhibition, and to take care that those which are sent are such as fairly represent the industry of their fellow countrymen.

Her Majesty's Commissioners will consider that to be the central authority in each case which is stated to be so by the Government of its country. Having once been put in communication with a central authority in any country, they must decline, absolutely and entirely, any communication with private and unauthorized individuals; and should any such be addressed to them, they can only refer it to the central body. This decision is essentially necessary, in order to prevent confusion.

The Commissioners do not insist upon articles being in all cases actually forwarded by the central authority, though they consider that this would generally be the most satisfactory [illegible] but it is indispensable that the sanction of such authority should in all cases be distinctly given, and that it be held responsible for the fitness of such articles for exhibition, and for not authorizing the exhibition of a greater quantity than can be accommodated in the space assigned to the productions of the country in question.

In case the central authority in any country should be of opinion that the space allotted to the productions of that country is greater than it will require, the Commissioners have to request that this opinion may be communicated to them, as it is obvious that it would not appear well if a large vacant space should be left in the department assigned to any country.

A definite quantity of space was in like manner offered to each of the British Colonies in the following proportions, and subject to the same rules for admission:

	Net superficial Feet allotted.		Net superficial Feet allotted.
[illegible] Colonies—		Nova Scotia and Cape Breton	1,000
New South Wales	2,000	Prince Edward's Island	250
New Zealand	500	St. Helena	50
South Australia	350	Sierra Leone	150
Van Diemen's Land	600	West India Colonies—	
West Australia	850	Antigua	375
Bermudas	50	Bahamas	100
Canada	4,000	Barbadoes	750
Cape of Good Hope and Natal	750	British Guiana	100
Cape Coast Castle and Dependencies	100	Dominica	125
Ceylon	1,500	Granada	250
Falkland Islands	25	Jamaica	1,500
Gambia	100	Montserrat	50
Gibraltar	100	Nevis	100
Hong Kong	Nil.	St. Christopher's	250
Hudson's Bay Co.'s [illegible]	1,000	St. Lucia	250
India, including S[illegible]	30,000	St. Vincent	250
Ionian Islands	1,000	Tobago	100
Labuan	250	Tortola and Virgin Islands	50
Malta	1,000	Trinidad	750
Mauritius	750		
New Brunswick	750	Total	51,025
Newfoundland	500		

It was intimated that colonial and foreign productions would be admitted for the purposes of exhibition without payment of duty. The building of the Exhibition has been considered as a bonded warehouse, and the Commissioners of Customs have afforded the utmost facilities consistently with that obedience to Customs' laws which was imperative.

Those who have had experience only of the continental systems of exhibitions, which are managed and paid for wholly by their Governments, find it difficult to understand the self-supporting and self-acting principle of the present Exhibition, which has hitherto depended wholly upon the voluntary subscriptions of the British people; the heavy liabilities which still hang over the undertaking rest wholly upon individuals in their private capacity, and not upon the Government. The British people, as well poor and working men, as the richer classes, have had the undivided responsibility, not only of conducting the first experiment of an Exhibition of their own works on a national scale, but of collecting funds to pay all the expenses of an Exhibition of the Works of all Nations. The National Exchequer has not been charged with any portion of [illegible] tributions of the most remote towns have been received and applied, payment of the military and police assistance which the Government has permitted to be employed on the occasion. So completely spontaneous has been the organization for the Exhibition, that not even the several municipal councils throughout the country were employed, but an independent organization was created for the express purpose wherever a locality was disposed to form its own Local Committee. Without the assistance of the Local Committees of the United Kingdom, no Exhibition of the Works of Industry of all Nations could ever have been accomplished.

Local Committees of the United Kingdom.

About 65 Local Committees had been formed before the issue of the Royal Commission, with the assistance of the Members of the Society of Arts, who had been nominated by the President to visit different parts of the kingdom. To extend this organization over the whole kingdom, into Local Committees, was one of the first acts of the Royal Commission. A circular was issued to the Mayors of all towns within the United Kingdom, having a municipal constitution (*Min.* i., p. 1), announcing the issue of the Royal Commission, and requesting, if no Local Committee had been formed, that the mayor would communicate with the principal inhabitants for the purpose of ascertaining whether, in their opinion, the circumstances of the town rendered it advisable to appoint a Local Committee. The functions of these Local Committees have chiefly consisted in the recommendation of Local Commissioners to represent the interests of their localities—in encouraging the production of suitable objects for exhibition—in affording information in the locality relative to the Exhibition—in the collection of subscriptions—and in facilitating the means of visiting the Exhibition.

The Commissioners intimated that it was their wish to limit, as far as possible, the necessity for the exercise of the powers of rejection and selection of objects intended for exhibition, and for that purpose to call to their assistance the local knowledge and discretion of the several Local Committees. They recommended that the Local Committees should enter into personal communication with those persons resident within their district, who were likely to be exhibitors; and that they should ascertain the character and number of the objects which it would be their wish to send to the Exhibition. For the purpose of communicating with the Local Committees, the Commissioners appointed Dr. LYON PLAYFAIR, and Lieut.-Colonel LLOYD, Surveyor-General of the Mauritius, Special Commissioners.

Demand for space by British exhibitors.

It was not required that exhibitors should of necessity be subscribers to the fund. All persons desirous of contributing articles to the Exhibition of 1851, were invited to give notice of such intention, and transmit a general description of the nature of each article, and the space which would be required for the exhibition of it, to the Secretary of the nearest Local Committee, and the Local Committee was requested to digest the returns so made to them, and transmit them to the Commission before the 31st Oct., 1850. It was not necessary in the first instance either to exhibit to the Local Committee specimens of the articles to be sent, or to give a minute specification of them. But it was decided that it was necessary for intending exhibitors to obtain the certificate of the nearest Local Committee, of its approval of the articles sent for exhibition, before they could be received by the Commissioners in the building. Upwards of 330 Local Committees were formed in the three parts of the United Kingdom and the Channel Isles. A list of those which have transmitted subscriptions to the fund, or sent articles to the Exhibition, will be found in the Appendix.

The 31st October was appointed the last day when the Local Committees were required to transmit to the Executive Committee the demands for space which intending exhibitors had made through them.

exceed the possible allowance.

It then appeared that the whole of the demands for horizontal (floor and counter) space in the building which the Local Committees of the United Kingdom returned, exceeded 417,000 superficial feet of exhibiting space, being in excess of the amount of available space for the United Kingdom by about 210,000 superficial feet. The amount of vertical or wall space demanded was only 200,000 superficial feet. The number of persons who proposed to exhibit was upwards of 8,200.

Upon the receipt of these data the Commissioners proceeded to adjust the proportions of floor or counter space which it appeared desirable that the four sections of the Exhibition should occupy in the Building. Upon averages, furnished by the whole of the United Kingdom, and obtained by dividing the total amount of space apportioned to each section by the number of exhibitors in that section, the Commissioners, as a general rule, allotted to each Local Committee an amount of space in each section, in proportion to the number of exhibitors which had been returned by each Committee. The Commissioners left the allotment of space to each exhibitor absolutely to the discretion of each Local Committee. They desired that each Local Committee, in allotting space to the individual exhibitors, should, as far as possible, maintain the proportions of the four sections allotted to it, so that in the ultimate arrangement of the whole Exhibition, the space which each section might occupy, should agree as closely as was possible with the spaces fixed by the Commissioners. It was suggested that only those articles which did honour to our industrial skill as a nation should be admitted, and that the industry of the district should be represented with perfect fairness, so as to do the fullest credit to its industrial position.

Reduction of demands for space.

The Commissioners then proceeded to cause copies of each individual application for space to be transmitted to the respective Local Committees for revision and correction where necessary, which, when returned by the Committees, were considered as the vouchers for the admission of the articles, and as tantamount to *their unqualified approbation of the articles.* In no case could a Local Committee *increase* the amount of the *total* space allotted to it by the Commissioners. The Commissioners appointed the 10th December, as the last day on which vouchers were to be received, but it was not until the 10th January, and even much later in some cases, that the Executive Committee obtained the whole of them, by which their labours were considerably increased, and the arrangements delayed.

Appeals.

If any productions had been rejected by any Local Committee, and the proprietor of them desired to appeal against the decision, it was competent for him to address the Commissioners through the Local Committee, who forwarded the appeal, with their own observations, and the Commissioners, upon consideration of the circumstances, confirmed or negatived the decision. The appeals, however, were few.

With the view of providing against the exhibition of duplicate articles of manufacture, the Commissioners, in cases where duplicates might have been admitted by *different* Local Committees, intimated that they would call upon the exhibitors of such duplicates to produce a certificate from the actual makers, stating which of the exhibitors had arranged with the maker to be proprietor of the absolute and exclusive right of sale and distribution of such article, and the preference of admission would be given to that exhibitor who was the sole proprietor. The Commissioners were not called upon to exercise this power in a single instance.

Metropolis.

Although several Local Committees were formed in the Metropolis, the functions of rejection and selection of articles were performed by a united action of all the several Committees. Each Committee nominated Commissioners to represent a particular department of the Exhibition, who met together to consider the merits of the individual claims for space referred to them.

Such was the course of action by which the articles of British exhibitors were admitted to the Exhibition, and subjected to a preliminary judgment. Imperfect as it necessarily was, the general effect of it was satisfactory, and kept out of the Exhibition many unsuitable articles. Practically the system worked well, and there is no doubt that the Exhibition, as a whole, is a fair representation of the present state of British industry. An examination of the list of exhibitors shows that very few names indeed of artists or manufacturers of eminence are absent. It is probable, however, that there are fewer novelties in mechanical inventions than there would otherwise have been, had the Legislature provided against piracy of them at an earlier period than April, 1851.

The Building.

It is now time to speak of the origin of the Building, and of its general features, so far as they have influenced the system which has been adopted in classifying and arranging the articles in it. An account of its scientific construction will be found in another part of this volume.

As early as January, 1850, the Commission named a Committee "for all matters relating to the Building," consisting of—

The Duke of BUCCLEUCH.
The Earl of ELLESMERE.
Mr. BARRY, R.A.
Mr. CUBITT, Pres. Inst. C.E.
Mr. STEPHENSON.
Mr. COCKERELL, R.A.
Mr. BRUNEL.
Mr. DONALDSON.

Mr. CUBITT was elected Chairman of this Committee, and from the earliest period to the opening of the Exhibition, has given daily and unremitting attention to the subject, at great personal sacrifice of his valuable time. On the 21st of February, 1850, the Building Committee reported favourably on the fitness of the present site in Hyde Park, which had been suggested in the early stages of the undertaking, and for the use of which it had been already announced that HER MAJESTY'S permission had been obtained. The Committee ventured at once to recommend that upwards of 16 acres should be covered in; a bold step at that time (21st February), when no data whatever of the space likely to be filled had been received (*Min.* vii., p. 5). It was their opinion that it was desirable to obtain suggestions, by public competition, as to the general arrangements of the ground plan of the Building, and public invitations were accordingly issued. They also reported that when a plan for the general arrangement should have been obtained and approved, they would invite, by a second public notice, designs accompanied by tenders, from the builders and manufacturers of the United Kingdom, for the construction of the Building, in the form, and according to the general arrangement, which should be fixed upon. In answer to the invitation to send in plans, upwards of 245 designs and specifications were submitted. Of these 38 were contributed by foreigners: France sending 27; Belgium 2; Holland 3; Hanover 1; Naples 1; Switzerland 2; Rhein Prussia 1; Hamburg 1; 128 by residents in London and its environs; 51 by residents in provincial towns of England; 6 by residents in Scotland; 3 by residents in Ireland; and 7 were anonymous. All these plans were publicly exhibited during a month, from the 10th of June, at the Institution of Civil Engineers, Great George Street, Westminster. The Building Committee reported on the merits of them, selecting two lists of the competitors. They considered the one "entitled to favourable and honourable mention," and the second "entitled to further higher honorary distinction." But they accompanied their report with the important announcement, that in their opinion there was no "single plan so accordant with the peculiar objects in view, either in the principle or detail of its arrangement, as to warrant them in recommending it for adoption" (*Min.* xvii., p. 6). The Committee, therefore, submitted a plan of their own, and assisted by Mr. Digby Wyatt, Mr. Charles Heard Wild, and Mr. Owen Jones, they prepared extensive working drawings, which were lithographed. They issued invitations for tenders to execute works in accordance with them, requesting from competitors, in addition, such suggestions and modifications, accompanied with estimates of cost, as might possibly become the means of effecting a considerable reduction upon the general expense. In the actual instructions they stipulated that tenders, in which changes were proposed, would be only entertained provided they were "accompanied by working drawings and specifications, and fully priced bills of quantities."

First plan.

The Building Committee published in detail the reasons, both of economy and taste, which had induced them to prepare plans for a structure of brick, the principal feature of which was a dome two hundred feet in diameter. Public opinion did not coincide in the propriety of such a building on such a site, and the residents in the neighbourhood raised especial objections. The subject was brought before both Houses of Parliament; and in the House of Commons, on the 4th July, 1850, two divisions took place on the question, whether the proposed site should be used at all for any building for the Exhibition. In the one division, the numbers in favour of the site were 166 to 47, and in the second 166 to 46. The Commissioners published, at considerable length, a statement of the reasons which had induced them to prefer the site, and there can be no doubt that the force of this document mainly influenced the large majority in both divisions.

Mr. Paxton's proposal.

Whilst the plan of the Building Committee was under discussion, Mr. Paxton was led, by the hostility which it had incurred, to submit a plan for a structure chiefly of glass and iron, on principles similar to those which had been adopted and successfully tried by him at Chatsworth. Messrs. Fox, Henderson, and Co., tendered for the erection of the Building Committee's plan, and, strictly in accordance with the conditions of tender, they also submitted estimates for the construction of the building suggested by Mr. Paxton, and adapted in form to the official ground plan. An engraving of Mr. Paxton's original design was published in the *Illustrated London News*, 6th July, 1850, which, when compared with the building that has been actually erected, will show what changes were subsequently made. The Commissioners having fully investigated the subject, finally adopted, on the 26th July, Messrs. Fox, Henderson, & Co.'s tender to construct Mr. Paxton's building, as then proposed, for the sum of £79,800. Considerable modifications, additions, and improvements in the architectural details were subsequently made, which have raised the proposed original cost of the building. As soon as the decision was made, fresh working drawings had to be prepared, and every means taken for expediting the works. These were carried on under the superintendence of Mr. Cubitt, assisted by Mr. D. Wyatt, Mr. O. Jones, and Mr. C. Wild.

The formal deed of contract was not signed until the 31st October, although *the first iron column was fixed as early as the 26th September, 1850, the contractors having thereby incurred, in their preparations, a liability of £50,000 without any positive contract;* in fact, great reciprocal confidence was manifested by the contracting parties. Whatever objections were entertained originally against the use of the site, gradually disappeared during the progress of the present building, and have become changed into positive approval and admiration, of the building itself and assent to the particular location of it. It should, however, be stated that a deed of covenant, to remove the building and give up the site within seven months after the close of the Exhibition, namely before the 1st June, 1852, has been entered into between HER MAJESTY and the Commissioners. The deed was sealed on the 14th November, 1850.

At a very early period the Commissioners resolved that the whole space of any building should be equally divided, and that one-half should be offered to Foreign countries, and the other reserved to Great Britain and her colonies. And almost simultaneously with this decision, before the plans of any building were settled, offers were made to foreign countries, assuring them more than 210,000 superficial feet of net exhibiting space. But after the ground plan had been settled, and a calculation had been made of the amount of space unavailable for exhibition that was absorbed by the transept, the avenues, the courts and offices, &c., it became evident that the remaining space, after deducting what had been assured to foreigners, was considerably less than the proportion due to Great Britain and her colonies, and much below the demands and wants of British exhibitors. It was at first suggested that an additional structure should be erected to accommodate the agricultural implements, outside the building, but it was found that reasons both of economy and of management greatly preponderated in favour of building an additional gallery, which was accordingly done.

Classification and arrangement of articles.

In order to settle the positive arrangement of articles in the building, it became necessary to prepare a more precise system of classification than that furnished by the classified list of admissible objects which the Commissioners had first issued. The various systems which had been tried in the French Expositions proved that any system based upon an abstract philosophical theory was unsuitable, and particularly so to the present Exhibition. It was also desirable that the system of classification should be made conducive to the readiest mode of consulting the vast collection, both by the general visitor and by the juries, who would have to consider the merits of the whole. Dr. PLAYFAIR, to whom the Commissioners had confided the superintendence of the juries, suggested that whilst preserving the original quadrupartite divisions of the Exhibition into Raw Produce and Materials, Machinery, Manufactures, and Fine Arts, those subdivisions which had been determined by commercial experience, should be adopted as far as practicable, as the basis of the Classification. Eminent men of science, and manufacturers in all branches, were invited to assist in determining each one the boundaries of his own special class of productions; and it was resolved, for the purposes of the jury, to adopt thirty broad divisions, and to induce as far as practicable the application of this classification to all articles—both British and Foreign; always, however, bearing in mind the fundamental rule, that the productions of an exhibitor would not be separated, except in very extreme cases. Accordingly, with few exceptions, all articles have been divided into the following thirty classes.

To save repetition, the numbers of the jurors which have been since assigned to each class are here given.

SECTION I. *Raw Materials and Produce,—illustrative of the natural productions on which human industry is employed.*

	No. of Jurors.
1. Mining and Quarrying, Metallurgy, and Mineral Products	
2. Chemical and Pharmaceutical processes and products generally	
3. Substances used as food	6
4. Vegetable and Animal Substances used in manufactures, implements, or for ornament	8

SECTION II. Machinery for Agricultural, Manufacturing, Engineering, and other purposes and Mechanical Inventions,—illustrative of the agents which human ingenuity brings to bear upon the products of nature.

	No. of Jurors
5. Machines for direct use, including carriages, Railway and Naval Mechanism	12
6. Manufacturing Machines and Tools	12
7. Mechanical, Civil Engineering, Architectural, and Building Contrivances	
8. Naval Architecture, Military Engineering and Structure, Ordnance, Armour and Accoutrements	8
9. Agricultural and Horticultural Machines and Implements (exceptional).	
10. Philosophical Instruments and Miscellaneous Contrivances, including processes depending upon their use, Musical, Horological, Acoustical and Surgical Instruments	12

SECTION III. Manufactures,—illustrative of the result produced by the operation of human industry upon natural produce.

Designs for Manufactures are admitted in the same section with the class of articles for which they are proposed.

	No. of Jurors
11. Cotton	10
12. Woollen and Worsted	12
13. Silk and Velvet	10
14. Manufactures from Flax and Hemp	10
15. Mixed Fabrics, including Shawls	12
16. Leather, including Saddlery and Harness, Skins, Fur, and Hair	10
17. Paper, Printing, and Bookbinding	8
18. Woven, spun, felted, and laid Fabrics, when shown for Printing and Dyeing	10
19. Tapestry, including Carpets and Floor Cloths, Lace and Embroidery, fancy and industrial Works	10
20. Articles of Clothing for immediate, personal, or domestic use	8
21. Cutlery, Edge Tools and Hand Tools, and Surgical Instruments	6
22. General Hardware	12
23. Works in precious Metals, Jewellery, and all articles of luxury not included in the other classes	8
24. Glass	8
25. Ceramic Manufacture, China, Porcelain, Earthenware, &c.	8
26. Decoration Furniture and Upholstery, Paper Hangings, Papier Maché, and Japanned Goods	12
27. Manufactures in Mineral Substances, used for building or decorations, as in Marble, Slate, Porphyries, Cements, Artificial Stones, &c.	6
28. Manufactures from Animal and Vegetable Substances, not being woven, felted, or laid	6
29. Miscellaneous Manufactures and Small Wares	10

SECTION IV.

30. Fine Arts, Sculpture, Models, and the Plastic Arts generally, Mosaics, Enamels, &c.—illustrative of the taste and skill displayed in such applications of human industry . . . 12

It had been originally contemplated by the Commissioners, that the arrangement of the whole Exhibition should be, not merely on the basis of the four sections, but that each similar article should be placed in juxtaposition without reference to its nationality, or local origin. To effect this, in so vast an Exhibition and within the short period of two months allowed for the arrangement, it was absolutely necessary to know, before the arrival of the articles, the approximate amount of space each would be likely to occupy—so that each on its arrival might be placed as nearly as possible in its appointed spot. But the event proved that this information, particularly in the case of Foreign countries, was unattainable.

A request was made that each Foreign country should inform the Commissioners, on or before the 1st of September, what space would be likely to be occupied respectively by its raw materials, its machinery, its manufactures, and fine arts; but only Austria, Belgium, Zollverein, and North Germany complied with this request, and furnished the information in sufficient detail. The great distance of other countries rendered the transmission of the information impossible, and practically it was not known what articles many very important countries would send, until they actually arrived. No choice remained but to adopt a geographical arrangement; and it was not until so late a period as the month of December that the Commissioners were enabled to decide the principles upon which the articles should be arranged in the Building. Circumstances connected with the form of the Building itself, the absence of the necessary information from Foreign countries, the great pressure for time, and above all the vital importance of punctually opening the Exhibition on the first of May, induced the division of the ground floor of the Building into two parts—the one being awarded to Foreign countries, and the other to the British colonies and the United Kingdom.

Geographical arrangement for Foreign and Colonial articles.

The productions of the United Kingdom and the British colonies are generally grouped *westward* of the central transept. The productions of each foreign country are placed together *eastward* of the transept—except machinery in motion, which, on account of the motive power being at the *north-west end* of the building, is placed in that part of the building. The productions of each country are classified nation by nation, and as far as practicable into the thirty classes already mentioned. The position of each country is determined in the building by its own latitude. As a general rule, machinery is placed at the *north* side, and raw materials and produce brought to the *south* side of the building. The intermediate parts are occupied by manufactures and fine arts. There is hardly any choice in respect of *light*, which is nearly the same in all parts of the building. The *south* side, as well as the roof of the building both in the *north* and *south* sides, is covered with canvas. The sides of the upper and the gallery tier on the *north* are not so covered. As a general rule applicable both to foreign countries and the United Kingdom, space was allotted on the following data:—on the ground floor, each area of 24 feet by 24 feet containing 576 feet superficial, was accounted as yielding exhibiting area of 384 feet, it being considered that 192 feet would be a sufficient allowance for passages. The width of these was determined by experiments in the building and by experience of those in the British Museum, in the Soho Bazaar, &c. In the gallery, half of each area was deducted for passages, and the other half, or 288 feet, assigned as exhibiting space. If the exhibitor wished to have more passage-room, then he was obliged to obtain it by deducting it from his exhibiting space: and every exhibitor, desiring to attend himself, or by his representative, during the Exhibition, had to deduct the sitting or standing space for such attendant from the superficial floor or counter-space allotted to him.

Allotment of space and position in the building.

A glance at the plan shows the adoption of a simple system of main passages. There is a central avenue 7[illegible] feet wide running from east to west, which is partially used to display both works of art and remarkable specimens of manufacture, and likewise to afford sitting room; parallel to this on each of the north and south sides are two uninterrupted passages 8 feet wide, one extending the length of the building and the other taking the circuit of the walls on each side. Besides the transept there are six main passages 8 feet wide, running from *north* to *south*. These were established as passages which must not be infringed upon:

portions of the building being then assigned to Foreign countries and to groups of exhibitors, a considerable latitude was permitted to them in arranging the other passages; at the same time, as the erection of the second gallery brought the whole building into a system of courts, spaces in the form of courts were allotted to Foreign countries, home districts, and classes of objects, and every one was encouraged to preserve them as much as possible. Thus on the British side, at the north there are the several machinery courts—the carriage court—the mineral court—the paper court—the miscellaneous court—the East India court; whilst at the south, there are three courts respectively for printed fabrics, for flax and woollen, and mixed fabrics:—furniture has its court, so have the manufactures of Birmingham and Sheffield—agricultural implements have an extensive court, and there are courts for mediæval furniture, for sculpture, for Canada and colonies, and the East Indies; on the east or Foreign side, almost every country has one or more courts,—France having eight, Austria six, &c.

Spaces of the requisite dimensions having been set apart to receive the productions of the Colonies and each Foreign country, the charge of these departments, as well as the arrangement of the productions, was handed over to each commissioner or agent representing such Colonies or Foreign country.

Arrangement of British articles.

On account of the vast magnitude of the building, of the shortness of time available for arrangement after the completion of the building, which as the event proved was hardly a week before the opening, and of the delay in sending the goods, it was foreseen by the Executive Committee that it would be necessary to arrange the Foreign productions geographically and the whole of the British Exhibition, not by means of the articles themselves, but of descriptions of them, and to map out the whole space before the articles themselves arrived. Not a few of these descriptions were in the first instance most vague; the exhibitor desiring to reveal as little as possible of the specific character of his articles. Many exhibitors demanded space for "fabrics," without specifying whether they were even woven or plastic. Others returned "woven fabrics," leaving it doubtful whether they were made of cotton, wool, or flax; each forming a separate class. The demands for space, merely for "inventions" and "machines," were numerous. Hence, there have crept in some errors in arrangement which would have been avoided had the description been more precise. Another source of difficulty has been the miscalculations of the amount of space which exhibitors really wanted. So frequently was the meaning of the term "superficial" and "square" feet misunderstood; so often were the expressions "horizontal" and "vertical" space disregarded or confounded, that in planning the arrangement of the Exhibition the difficulties of the Executive Committee have been great, and mistakes inevitable. One instance will afford a sufficient illustration. An important manufacturing town demanded 9,000 feet of wall or vertical space for the exhibition of its shawls, but when the demand came to be investigated, it was found to mean a demand for 900 feet of frontage on the wall, 10 feet high, and 3 feet deep—practically a demand for 27,000 superficial feet—to be arranged in such a way as would occupy half the length of the whole Exhibition! This demand of 27,000, was eventually compressed within 1,800 superficial feet of horizontal space, and submitted to, it must be admitted, with good-natured forbearance. Indeed, it may be said, that whilst almost every exhibitor desired some kind of special arrangement, convenient to himself, but inconvenient to everybody else, almost every one submitted to a curtailment of space, and a constraint on his wishes, with a patience that greatly lightened the labours of the Executive Committee. In fact, owing to these circumstances, inevitable in such a work, without precedent or experience, and to the very late period at which some demands for space were made, it was only possible to make an approximate guess at the space which each of the classes of goods of the United Kingdom would occupy, and to leave a considerable margin for adjustments.

It should be borne in mind that every Foreign country was able to regulate the character of the arrangement by the articles themselves. The whole of its articles were first collected, and then the arrangement settled. Every Foreign country, in this respect, stood in the same position as an individual British exhibitor; but on the British side, the general arrangement, and almost the position of each of the 7,000 exhibitors, were necessarily fixed before the articles were brought into the building. An elaborate classified list of subjects included in each of the 30 classes was prepared, and recommended as a basis of arrangement to exhibitors, though, from the causes already stated, the systematic classification could not be carried out in so complete a manner as was desired.

At the British side, every exhibitor had entire control over his own allotment, the Commissioners, from an early period, having decided that each exhibitor was at liberty to arrange such articles in his own way, so far as was compatible with the convenience of other exhibitors and of the public. When the exhibitor's wishes involved expense, the exhibitor defrayed it himself. Glass cases, frames, and stands of peculiar construction, and similar contrivances for the display or protection of the goods exhibited, were provided by the person requiring them at his own cost. Persons who wished to exhibit machines, or trains of machinery in motion, were permitted to do so. The Commissioners found steam not exceeding 30 lbs. per inch gratuitously to the exhibitors, and conveyed it in clothed pipes to such parts of the building as required steam power. Arrangements were made to supply water at a high pressure gratuitously to exhibitors, who had the privilege of adapting it to the working of their machinery, &c. And the Chelsea Water-works contracted to supply 300,000 gallons of water per day, at the rate of £50 per month.

Catalogues.

It was decided that two Official Catalogues should be prepared and published by the authority of the Commission; the one of a large size, containing full notices of everything that the exhibitor desired to state, and the other an abridgment containing the names of the exhibitors only, with a very general summary of the articles they exhibited. The right of printing and publishing these was offered for competition. The contractors were at liberty to fix the price of the large Catalogue. The smaller Catalogue was to be sold at 1*s.*, and the contractors were bound to pay 2*d.* for every copy sold to the funds. Several parties tendered. The offer of Messrs. SPICER BROTHERS, and Messrs. CLOWES and SONS, as the highest, was accepted; the amount of their offer being £3,200 It was also provided (*Min.* xxix., p. 1), that should the number sold exceed 500,000 of the small edition, and 5,000 of the large, then the contractors should give a further sum for all sold over and above those numbers. The contract was sealed 6th January, 1851.

Insurance from

The insurance of goods from fire, or other kinds of accidents, and the responsibility for all losses, devolved upon the exhibitors. The Metropolitan Fire

Brigade took charge of the safety of the Building from fire. With the permission of the Secretary of State for the Home Department, the responsibility for the whole of the police arrangements was placed upon Mr. MAYNE, *the Chief Commissioner of Police.* The Commissioners expressed their willingness to pay the sum of £5,043 19*s.* 4*d.*, in consideration of the Commissioners of Police providing the force necessary to be employed outside the Exhibition Building (viz., at the various entrances and approaches within Hyde Park), for the period of six months, from 1st March to 1st September, stipulating, however, that should it appear that the additional force which it was contemplated to provide was greater than was actually required, a proportionate reduction was to be made. The Commissioners left the question of the police force necessary for the interior watching of the building, and of the amount of expense in connection with it, in the hands of Her Majesty's Government, "in the full assurance that the utmost economy will be observed that is compatible with the satisfactory execution of that duty" (*Min.* xxxiii., p. 2).

Refreshments. The Commissioners considered that it would conduce to the convenience of visitors to permit light and moderate refreshments to be obtained and consumed in *certain prescribed parts* of the building but that it would be inconsistent with the nature of the Exhibition to allow the building to assume the character of an hotel, tavern, or dining-rooms. In the Central Area are sold ices, pastry, sandwiches, patties, fruits, tea, coffee, chocolate, cocoa, lemonade, seltzer and soda water; whilst in the Eastern and Western Areas are sold bread, butter and cheese, tea, coffee, chocolate, cocoa, ginger beer, spruce beer, and similar drinks, together with the other articles sold in the Central Area. No refreshments are to be taken out of the Areas. No wines, spirits, beer, or intoxicating drinks are permitted to be sold to the visitors. The privilege of supplying refreshments on these terms was put up to competition, and the tender of Messrs. SCHWEPPE, wherein they offered a sum of £5,500 for the privilege, was accepted. **Waiting rooms, &c.** Waiting rooms and conveniences have likewise been provided at a moderate charge at each of the refreshment areas.

With the view of affording information in respect of lodgings for the working classes which might be required in London, a register was opened, in which the names and addresses of persons disposed to provide accommodation for artizans from the country whilst visiting the Exhibition were entered. In doing this, the Commissioners intimated that they did not propose to charge themselves in any respect with the management, but simply to afford information. It was thought most expedient that the public should be led to make its own arrangements; and the object which the Commissioners had in view was simply to call public attention to the subject. Various kinds of organizations have arisen to meet any demands which may arise. The superintendence of this subject was intrusted to Colonel REID and Mr. ALEXANDER REDGRAVE.

Railway facilities. The principal railways agreed to afford some increased public accommodation during the Exhibition. Each Railway Company, both in the carriage of goods and passengers, and in the conveyance and delivery of articles intended for the Exhibition, allowed a deduction of one-half of the railway charge to exhibitors, subject to certain conditions. In order to encourage the early formation of "Subscription Clubs" in the country, to enable the labouring classes to travel to London and back during the Exhibition, the Railway Companies undertook to convey all persons so subscribing to local clubs at a single railway fare for both journeys, up and down, which should in no case exceed the existing fare by Parliamentary trains for the journey in one direction, with some abatement for longer distances, subject to the following conditions, which they published in September, 1850:—

> That in respect of journeys to London, the first 100 miles shall always be charged as 100 miles, and where the distance shall exceed 100 miles, an allowance in the fare be made on the following scale:—
>
> For the first excess 100 miles, 1–5th, or 20 per cent. be allowed.
> For the second excess 100 miles, 3–10ths, or 30 per cent. be allowed.
> For the third excess 100 miles, 2–5ths, or 40 per cent. be allowed.
> For the fourth excess 100 miles, ½ or 50 per cent. be allowed.
>
> Thus for instance:—
>
> A distance of 150 miles will be paid for as 140 miles.
> " 200 " " 180 "
> " 300 " " 250 "
> " 400 " " 310 "
> " 500 " " 360 "
> and in like proportion between the respective distances.

Regulations respecting the admission of visitors.

The consideration of the admission of Visitors was, in the first instance, referred to a Committee, and upon the recommendations of their Report, the Commissioners published decisions, in which they stated that their attention had been principally directed to the following points:—

1st. The necessity of making such arrangements as shall secure the convenience of the public visiting the Exhibition, whether for study and instruction, or for the more general purposes of curiosity and amusement. 2nd. The due protection and security of the property deposited in the building. 3rd. The effective control over the number of visitors, while the servants and officers intrusted with the maintenance of order and regularity in the building are comparatively inexperienced in their duties. 4th. The necessity of maintaining the self-supporting character of the Exhibition, and of defraying the liabilities incurred. 5th. The desire of the Commissioners to render the Exhibition accessible to all persons at the lowest possible charge, and with the least delay which a due regard to the preceding considerations will admit.

Having these objects in view, Her Majesty's Commissioners have determined to adopt the following regulations:—

The Exhibition will be open every day (Sundays excepted).

The hours of admission and other details will be announced at a subsequent period.

The charges for admission will be as follows:—

Season tickets for a gentleman . . .	£3	3	0
Season tickets for a lady	2	2	0*

These tickets are not transferable; but they will entitle the owner to admission on all occasions on which the Exhibition is open to the public.

The Commissioners reserve to themselves the power of raising the price of the season tickets when the first issue is exhausted, should circumstances render it advisable. On the first day of exhibition season tickets only will be available; and no money will be received at the doors of entrance on that day.

On the second and third days the price of admission on entrance will be (each day)	£1	0	0
On the fourth day of exhibition	0	5	0
To be reduced on the twenty-second day to . .	0	1	0

---

* Reduced August 1 to £1. 11*s.* 6*d.* and £1. 1*s.*

From the twenty-second day the prices of admission will be as follows:—

On Mondays, Tuesdays, Wednesdays, and Thursdays in each week	1*s.* 0*d.*
On Fridays	2*s.* 6*d.*
On Saturdays till August 2	5*s.* 0*d.*
And on August 9 reduced to	2*s.* 6*d.*

No change will be given at the doors. This regulation is necessary to prevent the inconvenience and confusion which would arise from interruption or delay at the entrances. Should experience in the progress of the Exhibition render any alteration in these arrangements necessary, the Commissioners reserve to themselves the power of making such modifications as may appear desirable, of which due and timely notice, however, will be given to the public. At the first opening of the Exhibition, the hours of admission were fixed from 10 A.M. till 6 P.M., and subsequently altered to sunset.

Upon the question how far, and in what instances, any parties should be furnished with free admissions, the Committee reported,—

That it is very desirable that that privilege should be restricted to as few cases as possible, and feeling the importance of carrying out to the greatest practicable extent a regulation of this nature, they would submit whether it might not be expedient that the Commissioners should place themselves in the same position as the public in general with regard to the admission to the Exhibition. The members of the Executive Committee have expressed their wish to subject themselves to the same conditions as the Royal Commissioners in this respect.

The following are the cases in which the Committee would recommend that an exception to the general rule should be made, and free admissions granted:—

1st. Persons in the employment of, and provided with tickets issued by the Executive Committee, such as the heads of sectional departments, the clerks, the watchers, the cleaners, the Police, the Sappers and Miners. 2nd. Servants of Foreign Commissioners and of exhibitors admitted under the provisions of the 14th published decision of the Commissioners for the purpose of watching the goods sent by their employers, or explaining them to visitors; such servants being provided with tickets issued by the Executive Committee under strict regulations to be hereafter laid down. 3. The press, both metropolitan and provincial; the tickets in both cases admitting the editor or his representative. 4th. The juries, on the production of tickets that have been issued and registered by the Executive Committee, on certain days to be hereafter fixed by the Executive Committee.*

And the power of carrying these rules into effect was given to the Executive Committee.

The inauguration of the Exhibition took place on 1st May, in accordance with the arrangements laid down in the accompanying document, which was published by the Commissioners:—

Her Majesty having signified her royal pleasure that arrangements should be made to enable Her Majesty to gratify a wish very generally expressed on the part of the public, to be present at a ceremony by which Her Majesty should open the Exhibition of the Works of Industry of all Nations, on the 1st of May, Her Majesty's Commissioners hereby give notice that the programme of this ceremony, and the regulations under which the holders of season tickets will be admitted, are as follow:—

Exhibitors' attendants who have been sanctioned by the Executive Committee will be admitted between the hours of 8 and 9 o'clock, at doors specified on their cards, and will immediately take their places by the counters or objects exhibited by their employers.

---

* The total number of visits made to the Exhibition was six millions and sixty-three thousand nine hundred and eighty-six (6,063,986), the highest number being on Tuesday, October 7, when it reached 109,915 persons.

Holders of season tickets will be admitted at all doors on the east, south, and west of the building, between the hours of 9 and half-past 11 o'clock, and will be allowed to take their places, subject to police regulations, in the lower part of the building, and in the galleries, except the parts railed off in the nave and transept.

A platform will be raised to the north of the centre of the transept, on which a chair of state will be placed.

Her Majesty's Commissioners will assemble at half-past 11 o'clock in the transept, opposite the platform, together with their Executive Committee and the Foreign Acting Commissioners, in full dress or in plain evening dress.

His Grace the Archbishop of Canterbury, Her Majesty's Ministers, the great Officers of State, and the Foreign Ambassadors and Ministers, will take their places on the platform to the right and left of the chair of state, in full dress, also at half-past 11 o'clock.

Her Majesty, proceeding in State, with the royal family, foreign guests, &c., and her and their suites from Buckingham Palace up Constitution Hill, and down Rotten Row, will enter the Exhibition building by the north entrance precisely at 12 o'clock. She will ascend the platform and take her seat in the chair of state.

On Her Majesty's arrival a choir will sing "God Save the Queen."

On the Queen taking her seat His Royal Highness Prince Albert will join the Royal Commissioners, and when the music has ceased proceed at their head to the platform, and read to Her Majesty a short report of the proceedings of the Commission up to that time, which he will then deliver to Her Majesty, together with the catalogue of the articles exhibited. Her Majesty will return a gracious answer, handed to her by the Secretary of State; after which His Royal Highness Prince Albert will take his place again by the side of Her Majesty.

His Grace the Archbishop of Canterbury will then say a prayer, invoking God's blessing upon the undertaking, followed by a short anthem sung by the choir.

A Royal procession will then be formed, preceded by the Commissioners, which will turn to the right, move to the west end of the nave by its north side, return to the east end of the nave by its south side, including the south end of the transept, and come back to the centre along the north side of the nave; thus enabling all those present, who will be expected to keep the places which have been assigned to them, to see Her Majesty and the procession.

During the procession the organs appointed will play marches, taking the music up at the Queen's approach.

On Her Majesty's return to the platform the Queen will declare "the Exhibition opened;" which will be announced to the public by a flourish of trumpets and the firing of a Royal Salute on the north of the Serpentine; whereupon the barriers, which had kept the nave clear, will be thrown open, and the public will be allowed to circulate.

Her Majesty will then return to Buckingham Palace by the route by which she came.

All the doors, which will have been closed at half-past eleven o'clock, will, upon Her Majesty's departure, be opened again.

Principles on which the prizes were awarded.

In announcing the PRIZES, the Commissioners laid down certain general principles for the guidance of the Juries, which they published as follows:—

In the department of RAW MATERIALS AND PRODUCE, for instance, prizes will be awarded upon a consideration of the value and importance of the article, and the superior excellence of the particular specimens exhibited; and in the case of prepared materials, coming under this head of the Exhibition, the Juries will take into account the novelty and importance of the prepared product, and the superior skill and ingenuity manifested in the process of preparation.

In the department of MACHINERY, the prizes will be given with reference to novelty in the invention, superiority in the execution, increased efficiency, or increased economy, in the use of the article exhibited. *The importance, in a social or other point of view, of the* purposes to which the article is to be applied, will also be taken into consideration, as will also the amount of the difficulties overcome in bringing the invention to perfection.

In the department of MANUFACTURES, those articles will be rewarded which fulfil in the highest degree the conditions specified in the sectional list, viz.:—Increased usefulness, such as permanency in dyes, improved forms and arrangements in articles of utility, &c. Superior quality, or superior skill in workmanship. New use of known materials. Use of new materials. New combinations of materials, as in metals and pottery. Beauty of design in form, or colour, or both, with reference to utility. Cheapness, relatively to excellence of production.

In the department of SCULPTURE, MODELS, and the PLASTIC ART, the rewards will have reference to the beauty and originality of the specimens exhibited, to improvements in the processes of production, to the application of art to manufactures, and, in the case of models, to the interest attaching to the subject they represent.

These general indications are sufficient to show that it is the wish of the Commissioners, as far as possible, to reward all articles in any department of the Exhibition, which may appear to competent judges to possess any decided superiority, of whatever nature that superiority may be. It is the intention of the Commissioners to reward excellence in whatever form it is presented, and not to give inducements to the distinctions of a merely individual competition. Although the Commissioners have determined on having three medals of different sizes and designs, they do not propose to instruct the Juries to award them as first, second, and third in degree for the same class of subjects. They do not wish to trammel the Juries by any precise limitation; but they consider that the Juries will rather view the three kinds of medals as a means of appreciating and distinguishing the respective characters of the subjects to be rewarded, and not of making distinctive marks in the same class of articles exhibited. They fully recognise that excellence in production is not only to be looked for in high-priced goods, in which much cost of labour and skill has been employed, but they encourage the exhibition of low-priced fabrics, when combining quality with lowness of price, or with novelty of production. They can readily conceive that Juries will be justified in giving the same class medal to the cheapest calico prints made for the Brazilian or South American market, as they would to the finest piece of *Mousseline de Soie* or *Mousseline de Laine*, if each possessed excellence of its own kind.

All persons, whether being designers or inventors, the manufacturers or the proprietors of articles, will be allowed to exhibit; but they must state the character in which they do so. They may also state the names of all or any of the parties who have aided in the production. In awarding the prizes, however, it will be for the Juries to consider, in each individual case, how far the various elements of merit should be recognised, and to decide whether the prize should be handed to the exhibitor, or to one or more of those who have aided in the production.

Lastly, the Commissioners, in announcing their intention of giving medal prizes, do not propose altogether to exclude pecuniary grants, either as prizes for successful competition, or as awards under special circumstances, accompanying, and in addition to the honorary distinction of the medal. There may be cases in which, on account of the condition of life of the successful competitor (as for instance, in the case of workmen) the grant of a sum of money may be the most appropriate reward of superior excellence; and there may be other cases of a special and exceptional nature, in which, from a consideration of the expense incurred in the preparation or transmission of a particular article entitled to a prize, combined with a due regard to the condition and pecuniary circumstances of the party exhibiting, a special grant may with propriety be added to the honorary distinction. The Commissioners are not prepared, for the present, at least, to establish any regulations on these heads. They consider it probable that a wide discretion must be left to the Juries, to be hereafter appointed, in respect to the award of money prizes, or the grant of money in aid of honorary distinctions; it being understood that such [illegible] is to be exercised under the superintendence and control of the Commission.

Articles marked "Not for Competition" cannot be [illegible].

The Commissioners decided to select bronze for the material in which the medals should be executed, considering that metal to be the better calculated than any other, for the development of superior skill and ingenuity in the medallic art, and at the same time the most likely to constitute a lasting memorial of the Exhibition. There are three bronze medals, of different sizes and designs, which were obtained by public competition. Three prizes of 100*l.* each, were awarded for the three designs of the reverses, which appeared the most meritorious, to the following artists:

M. Hippolyte Bonnardel, Paris.
Mr. Leonard C. Wyon, London.
Mr. G. G. Adams, London.

Three prizes of 50*l.* each were also given for the three best designs not accepted, as follows:

Mr. John Hancock, London.
Mons. L. Wiener, Brussels.
Mr. Gayrard, Paris. (*Min.* xxii., p. 2)

One hundred and twenty-nine models were received, and were exhibited in the rooms of the Society of Arts. The obverses of the medals are heads of Her Majesty the Queen, and His Royal Highness the Prince Albert, executed by W. Wyon, R. A., the medallist of the Mint, after the type of the Syracusan medals.

The Committee appointed (consisting of the Hon. W. E. Gladstone, the Lord Lyttelton, the Hon. T. B. Macaulay, and the Rev. H. G. Liddell, Head Master of Westminster School) to suggest inscriptions for the Prize Medals, recommended, for the medal to be executed after design No. 1, the following line, very slightly altered, from Manilius (Astronomicon, v. 737):—

"Est etiam in magno quædam respublica mundo."

For the medal from design No. 2, the following line from the first book of the Metamorphoses of Ovid (v. 25):—

"Dissociata locis concordi pace ligavit."

For the medal from design No. 3, the following line from Claudian (Eidyll., vii. 20):—

"Artificis tacitæ quod meruere manus."

Under the general conditions by which the juries were constituted, it was provided that there should be one jury to each of the 30 classes into which the Exhibition had been divided. The number of jurors in each jury was determined by the amount of articles exhibited in each class, and the greater or less diversity of the subjects included in it; but no abstract idea of the relative importance of the classes was involved in the numbers attached to them. The list of the 30 classes has already been given (*see* p. 23), with the number of jurors appointed to each class. In addition to the juries there described, it was found necessary to appoint three sub-juries; one subordinate to Class V., for carriages, and two subordinate to Class X., viz., [illegible] and for musical instruments. The *increased number of jurors for these three sub-juries was 22, of whom half* were foreigners.

To facilitate the working, especially with reference to the foreign jurors, the 30 classes were collected into six groups:—

Classes 1, 2, 3, 4, forming the group of Raw Materials.

Classes 5, 6, 7, 8, 9, 10, forming the group of Machinery.

Classes 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, forming the group of Textile Fabrics.

Classes 21, 22, 23, 24, 25, forming the group of Metallic, Vitreous, and Ceramic Manufactures.

Classes 26, 27, 28, 29, forming the group of Miscellaneous Manufactures.

The thirtieth class forming the group of Fine Arts.

A classified list of subjects under the province of each jury was prepared, and formed the limitation to each class, being the same as that upon which the arrangement of articles in the building had been made.

The constitution of the juries was thus regulated:—The jury in general consisted of an equal number of British subjects and of Foreigners. If Foreign Commissions did not send a sufficient number of Foreigners to represent one-half of the jurors in each class, the deficient numbers might be completed by the appointment of British subjects, or be made up by the persons named by the Foreign Commissioners in London. Country as well as metropolitan districts were represented on the jury. Each jury was presided over by a chairman nominated by the Commissioners, and he was aided by a deputy chairman elected by the jury. Juries were able to appoint one of their own body as a reporter. The chairmen of the thirty juries were associated as a body, and called the "Council of Chairmen." In the absence of a chairman, the deputy-chairman took his seat at the Council. The Council of Chairmen was constituted, as far as practicable, of British subjects and Foreigners in equal numbers. The first and chief duties of the Council of Chairmen were to frame the rules for the guidance of the juries. The Council had to determine the conditions under which the 1st, 2nd, and 3rd class medals respectively were to be awarded, and to define the general principles to which it would be advisable to conform in the awards in the several departments of the Exhibition. It was the wish of the Commission that medals should be awarded to articles possessing decided superiority of whatever nature that superiority might be, and not with reference to a merely individual competition. The Juries were reminded that "the three classes of medals are intended to distinguish the respective characters of subjects, and not as first, second, and third in degree for the same class of subjects." It was the function of the Council of Chairmen to see that the awards of the individual juries were in accordance with the rules before they were considered final. The propriety of pecuniary grants to individual exhibitors as considered by the Commissioners only on the recommendation of the several juries, sanctioned by the Council of Chairmen.

Ap
Eng

The mode of appointing the English jurors was as follows:—Those towns which exhibited to a considerable extent in any of the classes were invited to send a list of names of persons who would efficiently represent the knowledge of those classes as jurors. It was necessary to state according to the classified jury list, the subdivisions of the class with which the person recommended was specially acquainted; and all nominations were made in classes, and not in the aggregate.

As it was necessary to reduce the lists to the standard number for each jury, the Commission charged itself with this duty. Those persons who had been recommended as jurors, but who from the small numbers of the jury were not placed on it, might, on the application of a jury, be called in on special occasions to give aid, under the title of associates, but without a vote.

and Foreign Jurors.

The nomination of the foreign jurors was conducted on a somewhat different principle. The Foreign Commissioners submitted, that a fuller representation of the foreigners of all nations in the body which it was proposed to constitute for the purpose of confirming the award of individual juries would be secured, by referring the awards for confirmation to a general meeting of the juries of *allied* subjects, according to the groupings already spoken of. And the Commissioners assented to this modification. The selection of jurors for each foreign country was of course left to that country; persons of skilled knowledge being chosen to represent those classes of objects in which the country was a considerable exhibitor. It was recommended that in cases where the Central Commission was too remote to obtain the nomination of the jurors in sufficient time, the Foreign Commissioners should put themselves into communication with the diplomatic representatives of their respective countries in London. The number of jurors allotted to each foreign country by the Commissioners, upon the suggestion of the Foreign Commissioners, was as follows:—Austria, 15; Zollverein, comprehending Bavaria, Prussia, Saxony, Wurtemburg, &c., 19; Belgium, 11; North Germany, comprehending Bremen, Hamburgh, and Hanover, 3; Denmark, 1; France, 32; Greece, 1; Holland, 2; Portugal, 2; Russia, 6; Italy, comprehending Sardinia and Tuscany, 6; Spain, 3; Sweden and Norway, 1; Switzerland, 4; Turkey, 3; United States, 21; Egypt, 2.

If exhibitors accepted the office of jurors, they ceased to be competitors for prizes in the class to which they were appointed, and these could not be awarded either to them individually, or to the firms in which they might be partners. Juries were at liberty to take evidence when a majority of the jury deemed it advisable, and to name the persons to be consulted. Jurors of another class might also be called in aid by a jury, when a knowledge involved in that class was required. Juries were empowered to act in matters of detail by sub-committees, but no award could be made except by the majority of the jury. Before a jury could finally make its awards, it was necessary they should have been submitted to a meeting of the juries of allied subjects, as indicated in the groups. These meetings of allied juries had power to confirm the award of the juries, and to investigate any disputed decisions. Before, however, the awards were published, it was requisite they should have been submitted to a Council, consisting of the chairmen of the juries, in order to secure uniformity of action, and a compliance with the regulations originally laid down by that body. The awards of a jury, when reported by the Council of Chairmen as being made in conformity to the rules, were final. The juries were aided in the general transaction of the business by a person named by the Royal Commissioners, who himself, or by a deputy approved of by the Commission, was present at their deliberations, for the purpose of explaining the rules of the Commission. This nominee of the Commission, who was Dr. Lyon Playfair, did not have a vote in any of the juries, or at all interfere in the adjudication of awards.

The Exhibition is open to tell its own tale, and is now submitted to the judgment of the world. Conclusion.

All that has been done has been the work of a short and anxious period of sixteen months. During that time, Her Majesty's Commissioners have assembled together upwards of forty times, to discuss and determine all principles. When the Commissioners were not sitting, every important detail of action was considered by His Royal Highness, the President, and by Lord GRANVILLE, as Chairman of the Finance Committee. From time to time, as their services have been required, the most distinguished persons in art and science have met in Committees, liberally to afford their assistance to the Commissioners. These gentlemen, to whom the Exhibition is thus indebted, are named elsewhere; and it may be permitted to append a list of the staff, materially strengthened by officers of the Royal Engineers, both of Her Majesty's and the Honourable East India Company's service, which has carried the work into execution, and also to acknowledge the effective aid of the Sappers and Miners who have been permitted by the Master General of the Ordnance to bring their military discipline and business knowledge to aid in the arrangements of the Exhibition.

The work is done, and the collection made of the productions of 15,000 exhibitors, working with the ability God hath given them. To these we may say with St. Paul,—"In lowliness of mind let each esteem others better than themselves." And to spectators we may reiterate the hope expressed by the PRINCE, that "the first impression which the view of this vast collection will produce will be that of deep thankfulness to the Almighty for the blessings which he has bestowed upon us already here below; and the second, the conviction that they can be only realized in proportion to the help which we are prepared to render to each other—therefore, only by peace, love, and ready assistance, not only between individuals, but between the nations of the earth."

HENRY COLE.

Exhibition, Hyde Park,
30th April, 1851.

Postscript.—The Exhibition closed to the public on the 11th of October. The exhibitors and their friends were admitted on the 13th and 14th, and on the 15th, a meeting of the Commissioners, with their Staff, was held in the Building, to which the exhibitors, jurors, foreign and local Commissioners, members of Local Committees, and members of the Society of Arts were invited. The Exhibition was then officially brought to a close by the presentation of the Reports of the Juries by Lord Canning, who, on behalf of the Council of Chairmen, read an address to Her Majesty's Commissioners, to which His Royal Highness the President replied; after this the Bishop of London delivered a prayer of thanksgiving: the Hallelujah Chorus was sung—the meeting dispersed, and the removal of the articles from the Building commenced.

LIST OF COMMISSIONERS, &c. APPOINTED ABROAD TO PROMOTE THE EXHIBITION OF 1851 IN LONDON.

FRANCE.

La Commission générale, instituée par arrêtés des 28 Février et 11 Mars 1850, s'est, dans sa séance du 16 Mars, divisée en 6 Commissions spéciales, dont voici les attributions et la composition :*

1° Commission des Affaires administratives et de la Correspondence.

M. Charles Dupin, de l'Académie des Sciences, Président de la Commission Générale.

M. de Lesseps, Directeur des Consulats et des Affaires Commerciales au Ministère des Affaires Etrangères.

M. de Lavenay, Secrétaire-Général du Ministère de l'Agriculture et du Commerce.

M. Monny de Mornay, Chef de la division de l'Agriculture.

M. Fleury, Chef de la division du Commerce Extérieur.

M. Delambre, Chef de la division du Commerce Intérieur.

M. Chemin-Dupontès, Chef du Bureau des Faits-Commerciaux, Secrétaire de la Commission Générale.

2° Commission des Arts Agricoles.

M. Hericart de Thury, de l'Académie des Sciences.

M. Tourret, Vice Président du Jury Central.

M. Payen, de l'Académie des Sciences.

M. Armand Seguier, de l'Académie des Sciences.

M. de Kergorlay, Membre de la Société Nationale et Centrale d'Agriculture.

M. Monny de Mornay.

3° Commission des Arts Mécaniques et de Précision.

M. Pouillet, de l'Académie des Sciences.

M. Armand Seguier, de l'Académie des Sciences.

M. Morin, de l'Académie des Sciences.

M. Combes, de l'Académie des Sciences.

M. Michel Chevalier, Ingénieur en Chef des Mines.

M. le Chatelier, Ingénieur des Mines.

4° Commission des Arts Chimiques et Métallurgiques.

M. Balard, de l'Académie des Sciences.

M. Hericart du Thury.

M. Payen.

M. Michel Chevalier.

M. Ebelmen, Directeur de la Manufacture Nationale de Sèvres.

M. le Chatelier.

5° Commission des Tissus.

M. Mimerel, Président de la Commission des Tissus au Jury Central.

M. Legentil, Président de la Chambre de Commerce de Paris.

M. Barbet, Membre du Jury Central de l'Industrie Nationale.

M. Sallandrouze de Lamornaix, Membre du Jury Central.

M. de Lavenay.

6° Commission des Beaux-Arts et Arts divers.

M. Fontaine, de l'Académie des Beaux Arts.

M. Leon de Laborde, de l'Académie des Beaux Arts.

M. Armand Seguier.

M. Ebelmen.

M. de Lavenay.

M. Delambre.

Dans une deuxieme séance qui a eu lieu le 20 courant, ont été élus Présidents des diverses Commissions:—

I. Commission Administrative	M. Charles Dupin.
II. Commission des Arts Agricoles	M. Hericart de Thury.
III. Commission des Arts Mécaniques et de Précision . .	M. Combes.
IV. Commission des Arts Chimiques et Métallurgiques	M. Hericart de Thury.
V. Commission des Tissus .	M. Legentil.
VI. Commission des Beaux Arts et Arts divers	M. Fontaine.

Tous les renseignements destinés à la Commission doivent être adressés au Ministère de l'Agriculture et du Commerce.

BELGIUM.

President.— M. de Brouckère, Bourgmestre de la Ville de Bruxelles, Membre de la Chambre des Représentants, Président du Jury l'Exposition Industrielle de 1847.

Membres.— M. Bellefroid, Chef de la Division de l'Agriculture au Départment de l'Intérieur.

M. Benôit Faber, Délégué de la Chambre de Commerce de Namur.

M. Capitaine, Fabricant à Liège, délégué de la Chambre de Commerce de cette Ville

M. Claes (Paul) de Lembecq, Agronome.

M. Kindt, Inspecteur pour les Affaires Industrielles, au Départment de l'Intérieur.

M. Kums, Fabricant à Anvers, délégué par la Chambre de Commerce de cette Ville

M. Manilius, Membre de la Chambre des Représentants, délégué par la Chambre de Commerce de Gand

M. Overman, Fabricant à Tournay, délégué par la Chambre de Commerce de cette Ville.

M. Partoes, Directeur du Commerce Extérieur et des Consulats au Départment des Affaires Etrangères.

M. Quoilin, Secrétaire Général au Départment des Finances.

M. Romberg, Chef de la Division de l'Industrie au Départment de l'Intérieur.

M. Simonis, (Armand). Président de la Chambre de Commerce de Verviers.

M. Spitaels, (Ferdinand), Membre du Sénat, délégué par la Chambre de Commerce de Charleroy.

M. Van Hooff, Fabricant à Saint-Nicolas, délégué par la Chambre de Commerce de cette Ville.

M. Vercruysse-Bruneel, (H.), Fabricant à Courtray, délégué de la Chambre de cette Ville.

M. Verreyt, Fabricant à Bruxelles, délégué par la Chambre de Commerce de cette Ville.

---

* Voir le Moniteur du 21 Mars 1850.

NETHERLANDS.

President—M. Jonkhur D. R. Givers Deynoot, Directeur de la Société pour l'Encouragement de l'Industrie à Haarlem, demeurant à Rotterdam.

Membres—M. le Docteur G. Simons, Directeur de l'Académie Royale à Delft.

M. D. G. Buchler, Membre de l'Institut Royal des Pays-Bas, Vice-Président de l'Académie Royale des Beaux Arts à Amsterdam.

AUSTRIA.—A Commission formed, consisting of the following Members:—

Präsident— Herr Andreas Ritter v. Baumgartner, k. k. geheimer Rath, Sections-Chef im Ministerium der Finanzen, Vice-Präsident der k. k. Akademie der Wissenschaften in Wien, &c.

Präsidentens-Stellvertreter— Herr Michael Ritter v. Spörlin, Fabriksinhaber, Mitglied der Wiener Handelskammer.

Vertreter der Ministerien—Herr Dr. Karl Hock, Ministerialrath im Ministerium des Handels.

Herr Dr. Moriz Ritter v. Besteneck, Sectionsrath im Ministerium der Finanzen.

Herr Joseph Kudernatsch, Sectionsrath im Ministerium des Bergbaues und der Landes-Cultur.

Schriftführer—Herr Heinrich Henking, Ministerial-Secretär. Commissions-Mitglieder für Nieder-Oesterreich.

Herr Theodor Hornbostel, Fabriksinhaber, Prasident der Wiener Handelskammer und des Nieder-Oesterreichischen Gewerbs-Vereines.

Herr Carl Rösner, Professor der Baukunst und provisorischer Prasident der k. k. Akademie der Künste in Wien.

Herr Adam Ritter v. Burg, k. k. Regierungsrath, Director des Polytechnischen Institutes und Vice-Prasident des Nieder-Oesterreichischen Gewerb-Vereines.

Herr Paul Sprenger, Sectionsrath der General-Baudirection.

Herr A. Steinheil, Sectionsrath im Ministerium des Handels.

Herr Jacob Regenhart, Kaufmann und Fabriksinhaber,
Herr Johann Mayer, Groszhandler und Fabriksinhaber,
Herr Ludwig Damböck, Fabriksinhaber,
Herr Joseph Zeisel, Fabriksinhaber, } Mitglieder der Wiener Handelskammer.

Herr Ludwig Hardtmuth, Fabriksinhaber,

Herr Gustav Höfken, Sectionsrath im Ministerium des Handels.

Herr Franz Freiherr von Leithner, k. k. Regierungsrath und Fabriks-Director.

Herr Alois Auer, k. k. Regierungsrath und Director der Staatsdruckerei.

Herr Anton Schrötter, Professor der Chemie, Mitglied der Akademie der Wissenschaften in Wien.

Herr Ludwig von Brevilliers, Fabriksinhaber.

Herr Georg Endris, Groszhandlungs-Dirigent.

Herr Theodor Gulchern, Fabriksinhaber.

Herr Carl Leistler, Tischlermeister.

Herr Matthaus Edler von Rosthorn, Gewerke.

Herr Heinrich D. Schmidt, Fabriksinhaber.

Herr Otto Schumann, Kaufmann.

Herr Dr. Wilhelm Schwarz, Secretär der Wiener Handelskammer.

Herr Emil Seybel, Fabriksgesellschafter.

Herr Johann B Streicher, Claviermacher.

Herr Ernst Weidinger, Fabriks-Director.

Commissions-Mitglieder für Böhmen.

Herr Franz Graf von Harrach, Fabriksinhaber und Präsident des böhm. Gewerb-Vereins,
Herr Carl Balling, Professor der Chemie & Vice-Präsident des böhm. Gewerb-Vereins,
Herr Johann B. Riedel, Kaufmann & Vorsteher des Handelstandes,
Herr Dr. Carl Kreutzberg, Fabriksinhaber,
Herr B. von Partheim, Fabriksinhaber
Herr Franz Richter, Fabriksinhaber. } in Prag.

Herr Johann Liebig, Fabriksinhaber und Prasident des Gewerb-Vereines,
Herr Wilhelm Sigmund, Fabriksinhaber. } in Reichenberg.

Herr Carl Fischer, Fabriksinhaber in Pirkenhammer.

Herr Eduard Leitenberger, Fabriksinhaber in Reichstadt.

Herr A. D. Mayer, Fabriksinhaber in Winterberg.

Herr M. Mayer, Bergswerks-Director in Neu-Joachimsthal.

Herr Joh. Reinhold, Fabriksinhaber in Warnsdorf.

Commissions-Mitglieder für Mähren und Schlesien.

Herr Hugo Furst von Salm-Reifferscheid-Krautheim, Fabriksinhaber und Prasident der Mahrisch-Schlesischen Landwirthschaftsgesellschaft.

Herr Leopold Haupt, Fabriksinhaber.

Herr Florentin Robert, Fabriksinhaber in Selowitz.

Herr Philipp Scholler, Fabriksinhaber in Brünn.

Herr Heinrich Zurhelle, Fabriks-Director in Namiest.

Commissions-Mitglieder für Galizien die Bukowina und das Gebiet von Krakau.

Herr Alfred Graf v. Potocky, k. k. geh. Rath und Fabriksinhaber.

Herr Joseph Ruszegger, k. k. Gubernialrath und Bergwerks-Director in Wieliczka.

Herr Carl Hausner, Groszhandler in Brody.

Herr Vincenz Kirchmayer, Groszhandler, in Krakau.

Herr Florian Seiger, Groszhändler, in Lemberg.

Commissions-Mitglieder für Ungarn, Croatien, Slavonien, Siebenbürgen die Woiwodina, das Temescher Banat und die Militärgranze.

Herr Graf Joh. Barkotzy, Grundbesitzer,
Herr August L. Krause, k.k. Cameralrath und Fabriken-Inspector,
Herr Christ. J. Malvieux, Groszhandler,
Herr Samuel v. Joob, Güter-Director } in Pesth.

AUSTRIA—*continued.*

Herr Joseph Ritter v. Ferro, k. k. Sectionsrath und Ministerial-Commissär, in Nagy-Banya.
Herr Carl Walburg, Kaufmann, in Kronstadt.
Herr Carl Meynier, Fabriksinhaber, in Fiume.
Herr Auton Tschopp, Groszhändler, in Carlstadt.

Commissions-Mitglieder für Steiermark, Kärnthen, Krain, Triest, Görz, Istrien, und Dalmatien.

Herr Doctor Franz Hlubeck, Professor und Secretär der Steiermärkischen Landwirthschafts-Gesellschaft, in Gratz.

Herr Dr. Carl Peintinger, Bergwerks-Director,
Herr Peter Tunner, Vorsteher der montanistischen Lehranstalt,
in Vordernberg.

Herr Thomas Ritter v. Moro, Fabriksinhaber,
Herr J. Schelieszniqg, Bergwerks-Inspector,
in Klagonfurt.

Herr Heinrich Costa, Oberamts-Director,
Herr William Moline, Fabriks-Director,
in Laibach.

Herr Kaliman Ritter v. Minerbi, Groszhändler und Fabriksinhaber,
Herr Carl Regensdorff, Groszhandlungs-Dirigent,
in Triest.

Commissions-Mitglieder für das Lombardisch-Venetianische Königreich.

Herr Graff Archinti, Fabriksinhaber,
Herr Ernst v. Mylius, Groszhandlungs-Gesellschafter,
Herr Albert Keller, Fabriksinhaber,
in Mailand.

Herr Joseph Ant. Reali, Fabriksinhaber,
Herr Peter Bigaglia, Fabriksinhaber,
Herr Ferdinand Zucchelli, Kaufmann,
in Venedig.

Commissions-Mitglieder für Tirol und Vorarlberg.

Herr Caspar Litti, Fabriks-Director,
Herr Joseph Mayer, Kaufmann,
in Innsbruck.

Herr Melchior Jenny, Fabriksinhaber,
Herr Johan Kennedy, Fabriksinhaber,
Herr Anton Rhomberg,
in Vorarlberg.

Herr Jos. Bettini, Fabriksinhaber, in Roveredo.
Herr Johann Putzer, Groszhandler in Botzen.

Commissions-Mitglied für Ober-Oesterreich und Salzburg.

Herr Johann Ritter v. Dierzer, Fabriksinhaber in Linz und Vorsteher der Delegation des Nieder-Oesterreichischen Gewerb-Vereines.

Herr Dr. L. Kompasz,
Herr Math. Lechner,
Delegirte des Nied Oesterr. Gewerb-Vereines in Steyer.

Herr Carl Mitterbacher, Fabriksinhaber, Salzburg.

PRUSSIA.—A Commission formed, consisting of the following Members :—

Geheimen Ober-Finanzrath von Vierbahn.
Geheimen Regierungsrath Delbruck.
Director des Königlichen Gewerbe-Instituts, Dr. Druckenmüller.
Professor Dr. Schubarth.
Fabriken Kommissionsrath Wedding.
Fabriken Kommissionsrath Brix.
Geheimen Kommerzienrath Carl.
Geheimen Kommerzienrath Baudouin.
Herr F. Zimmermann.
Herr Weigerl.
Herr Oertling.
Herr Dr. Ludersdorf.
Herr Bidtel.

BAVARIA.—The Polytechnic Society of Munich.

SAXONY.—M. le Dr. Weinlig, Conseiller intimé au Ministère de l'Intérieur.

HAMBURGH.—The Society for the Promotion of Arts and the Useful Professions. Dr. W. A. Kramer (*Secretary*).

BREMEN.—Dr. Henry Groning.

LUBECK.—The Trades Committee of the Patriotic Society.

WURTEMBURG.—Herr Sautter, President of the Central Society for Industry and Trade.

GRAND DUCHY OF HESSE DARMSTADT.

Privy Councillor Eckhardt, President of the Trades' Union of the Grand Duchy of Hesse.

NASSAU.—The Chamber of Commerce of Nassau, through its President the Assessor Odernheimer of Wiesbaden.

HANOVER.—Art-Union of Hanover.

SWITZERLAND.—A Co[illegible]sion formed, consisting of the following Members:—

Dr. Schneider, of Berne (*President*).
M. Bolley, Professor, of Aarau.
M. Colladon, Professor, of Geneva.
Major Courvoisier, Neuchatel.
M. Jenni, Manufacturer, of Glaris.
M. Sarasin, of Bale.
M. Sulzberger, Manufacturer, of St. Gall.
M. Ziegler-Pellis, of Winterthur.

RUSSIA.

Two Commissions formed, one at St. Petersburgh and the other at Odessa. The Royal Commissioners to communicate with them through the Agent of the Imperial Finance Department (M. Kamensky), who resides in London.

SWEDEN.—M. D. C. de Skoqman, Président du Collège du Commerce.

NORWAY.

M. Langberg, Professor of Natural Philosophy.
Colonel Garben, of the Engineers.
M. Yarbell, Mechanician.
Captain Vergeland, of the Artillery.
M. Schinner, Architect.
M. Vergman, Ornamental Painter.

Who together form the direction of the Society of Arts at Christiania.

DENMARK.—A Commission formed.

THE
CONSTRUCTION OF THE BUILDING.

The present industrial position of England indicated by the building, as well as the leading characteristics of her citizens, both personal

HAD circumstances determined that the present industrial position of England should have been represented by the building alone, while other nations should have been allowed to indicate the scope of their resources by a display of choice specimens of all the varied branches of productions to which their efforts had of late years been directed, it is singular to remark how few elements, essential to her commercial success, would have been lost sight of. The courage of her citizens would have been manifested in the vastness of the scheme; their energy, determination, and strength, in the surprising rapidity with which every operation had been carried on.

and social.

The happy condition of the liberty of the subject would have been attested by the circumstance of its having been in the power of the people alone to will the existence of so vast a structure; while the fact that the whole expenses had been provided for without in any way trenching on the national resources, would have evidenced at once the wealth and the spirit of enterprise common to every class of society.

Evidence given by the building of extent of national resources in the production of Raw Material,

Machinery,

Manufactures,

and objects of Fine Arts.

That it should have been possible in any country to have so speedily collected such a vast quantity of materials, without previously sounding the note of preparation, would have furnished strong evidence of the abundance of its native resources, and conveyed some faint idea of the extent of the stores of raw material kept ever ready to supply the exigencies of sudden demand. That that raw material should have been moulded into forms so various, so complex, and so original, in so short a time, would argue that such a result could alone have been effected by the natives of a country in which a knowledge of the principles and practice of mechanics and machinery had been long deeply studied and widely diffused. The facility with which the machinery employed must have been brought to bear upon the masses of raw material supplied, would have evidenced a power to produce, and to elaborate matter into manufacture, of the very highest order; while the grace with which the charm of decoration has been superadded, to so utilitarian a structure, would have served to show, that mindful as the English habitually are, of the practical and economical, they are by no means indifferent to the beautiful in the Fine Arts.

Organization of labour, and co-operation in supply, developed by

Whoever had been enabled to trace through every stage the progress of the Exhibition Building, from the first order given by the contractor, to the issue of the final directions for its opening, would have had an opportunity of realising the perfection to which the practice of connecting commercial co-operation in supply, great engineering works.

and mutual reliance in money and time bargains, with the methodical organization of labour, has been carried in England at the present time. It is by means of the experience acquired in the conduct of the vast engineering works which have of late years occupied the attention, and commanded the labours of some of her most intelligent citizens, that this country has been enabled to reduce to a perfect system this power of subordinating the supply of materials, and of eliciting, in similar works, that precise description of labour from every individual, for which his natural characteristics or education may have specially qualified him.

Combination and division of labour necessary to carry out such works.

The firm through whose exertions the building has been erected, in itself presents an excellent model of the commercial constitution necessary to produce such great works with rapidity. While of its heads, one is remarkable for high scientific attainments, another possesses singular commercial aptitude, together with a minute knowledge of the working details of his business. Others again, bring to the common stock of intelligence a precise knowledge of legal and monetary transactions, together with experience acquired in many years' connection with speculations of great magnitude. The principal superintendents and foremen set in operation by this intellectual motive power, are each adapted to the particular duties they may be called upon to perform, and act precisely as the various portions of a well-devised machine, being at the same time maintained in as perfect control. Through these agents the labour of the artisan, skilled in his own department, profoundly ignorant in others, is brought into useful operation; and thus thousands are combined to realise the will of one directing mind. But for the perfect system of discipline, which frequent practice in directing the labours of masses of workmen has now made general throughout England, it would have been impossible to have fashioned, in so short a time, so novel and so vast a structure as this Temple of Peace, the gates of which may, we trust, be thrown open to the world at large, for many years to come.

Division of the subject into—
I. The building as it stands.
II. Its creation.

How far the Exhibition Building conveys a true idea of English constructive power, can only be ascertained by a minute examination of its anatomy; and we shall therefore proceed to sketch in some detail its actual nature and appearance, and the successive steps by which it has grown into its present condition.

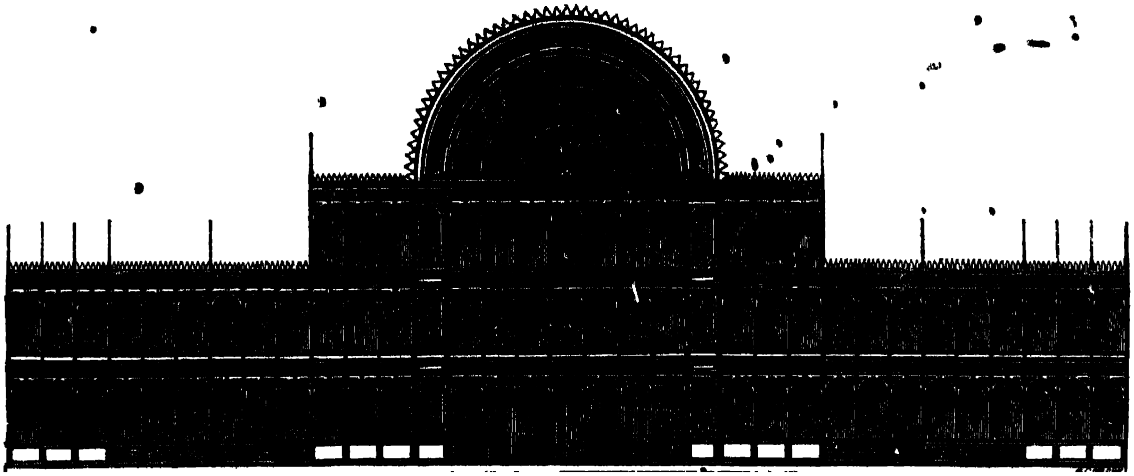
The site in Hyde Park.

The site for the building is the one originally proposed for it by H.R.H. PRINCE ALBERT at the first private meeting, held on the subject of the Exhibition, at Buckingham Palace, on the 30th June, 1849. It consists of a rectangular strip of ground in Hyde Park, situated between the Queen's Drive and Rotten Row, and contains about 26 acres; being approximately 2,300 feet in length, by 500 feet in breadth. Its principal frontage extends from east to west. Several lofty elms stretch across the centre of its length, and a few smaller trees are scattered over its area. These trees have for the most part been retained, and to the finest of them we are indebted for the existence of the beautiful transept roof; since, had they not presented difficulties to the construction of a roof of lower pitch, it is more than probable that the noble vault which now spans them would have been scarcely ventured on. The ground, although apparently level, actually falls, not less than 1 in 250 from west to east. From the popularity of the spot, the ease with which it can be approached, the opportunities for obtaining beautiful views of the building from every direction, and the facility with which it has been drained, and supplied with gas and water, it is scarcely possible that a site could have been found more admirably adapted for such a purpose, than the one upon which the building now stands.

The Building:—
Its principal entrance;

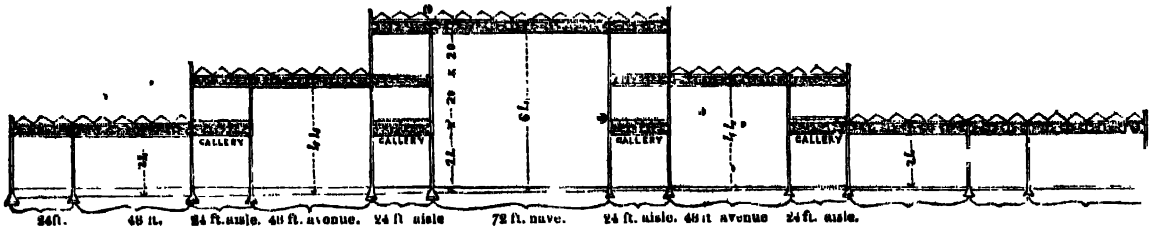
The principal entrance to the Exhibition is situated in the centre of the south side, opposite to the Prince of Wales's Gate, one of the main entrances to Hyde Park. From this gate a good view of the southern façade of the transept (shown in fig. No. 1) is obtained. Passing through a vestibule, 72 feet by 48, the visitor finds admittance to the main building, and stands beneath the roof of the great feature of the whole, the transept. Above his head, at a height of 68 feet from the ground, springs a semi-cylindrical vault, 72 feet in diameter, which extends for a length of 408 feet from south to north. On each side of the space so covered, runs an aisle 24 feet wide. The "coup d'œil" afforded by the transept is represented in Plate I.

Fig. 1.



The "coup d'œil" on entering;

Fig. 2.



Its central point,

Advancing about halfway along the transept, the visitor will find himself as nearly as possible in the centre of the building; and from this point his eye may range eastward and westward along its vast nave, for a distance of upwards of 900 feet in each direction; the total length of the building being not less, than 1848 feet. By reference to the ground plan given at page 1, and to fig. 2, a clearer idea may be formed of the manner in which the vast area, that thus opens itself to the view, has been distributed, than could be conveyed by many pages of description. The nave is a grand avenue 64 feet high and 72 feet wide, crossing the transept at right angles. On each side of it extend aisles 24 feet in width, and above them, at a height of 24 feet from the ground, are carried galleries, surrounding the whole of the nave and the transept; so that a complete circuit of communication is carried throughout the whole structure at that level.

Its extent,

and divisions c plan.

Beyond these first aisles, and parallel with them, at a distance of 48 feet, are second aisles of similar width, and similarly covered for their whole width with galleries on the same level as those over the first aisles. In order that the public may pass freely from one line of galleries to the other, bridges, at frequent intervals, span the 48 feet avenues, and at the same time divide them into courts, each of which has been so arranged as to present an "ensemble" to the eye of the spectator looking down upon it from the galleries. The width of 48 feet which we have described as thus subdivided, and the second aisles, are roofed over at a height of 44 feet from the ground. The remaining portion of the building in width consists of one story only, 24 feet high; in which, of course, there are no galleries. Ten double staircases, 8 feet wide, give access to these galleries.

Its lightness of proportion,

no evidence of instability.

The airy lightness of the whole structure, and its immense dimensions, are the features which will no doubt first excite the wonder, and perhaps the timidity of the visitor; but when he learns how rigidly the strength of every portion has been investigated, with what care the connection of every part has been made, and that the whole of that which appears to him so complicated, is but the repetition of a few simple elements, he will throw aside alarm, and rest upon the consciousness that those most competent to investigate questions of force to overturn, and strength to resist, have spared no pains to assure themselves of the perfection of the parts, and the consequent stability of the whole.

General nature of materials.

Quantities of wrought iron;

Cast iron;

Glass;

Wood.

The lightness of the proportions will at once assure the spectator of the nature of the material which forms the main supports of the building. While the vertical supports consist entirely of cast-iron, the horizontal connections and girders are constructed of both wrought and cast iron. Of wrought-iron it has been estimated that no less than 550 tons have been used, and of cast-iron 3,500 tons. The whole of the roof, above the highest tier of iron frame-work, consists of wood and glass, and the external enclosures and face-work are constructed almost entirely of the same materials. It is estimated that 896,000 superficial feet of glass, weighing 400 tons, have been employed; whilst the quantity of wood used, including the whole of the flooring, has been no less than 600,000 cubic feet.

The plan divided into squares of 24 feet.

In designing the building, care has been taken so to arrange that the position of every column shall occur at the points of intersection of lines, 24 feet apart, crossing one another at right angles, while in roofing and flooring the squares, into which the whole plan has been thus allotted, have been subdivided into others of 8 feet. This arrangement accounts for the beautiful regularity of the lines of the columns, &c., when viewed diagonally.

Necessity of realizing the detail of one 24-feet bay, in order thereby to judge of the whole area.

In order to afford some idea of the extent of mechanical difficulties involved in the erection of such a building, and to furnish, as it were, a scale by which to estimate the nature of the work, we shall proceed, before entering upon the subject of its general extent and arrangement, to describe the mode of construction of one of the 24-feet bays or compartments, taken at random from the side aisle adjoining the main avenue.

The description of a 24-feet bay commenced.

The foundations.

The exact situation of the four columns enclosing the space referred to having first been determined, holes were dug to such a depth as to lay bare the gravel; which extends, with scarcely a fault, over the whole surface of the site, at an average depth of between 2 and 4 feet. The size of the holes dug out for the foundations, and the quantity of concrete thrown into those holes in order to form a secure foundation for the superstructure, was determined by the estimated weight of that superstructure; and it was so arranged that, allowing for every possible contingency, under no circumstances should a pressure greater than 2½ tons per foot superficial be brought to bear upon the foundation.

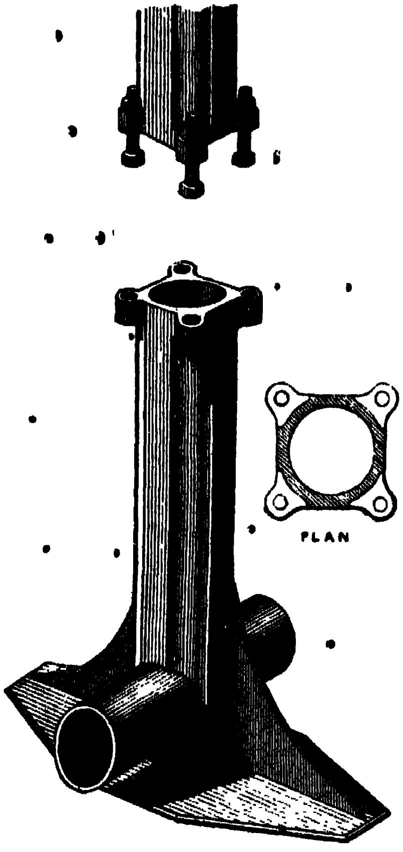
The base plates generally·

On the surface of fine mortar, with which the concrete was covered, was placed a casting, which has been technically called a *base-plate*. This casting is represented in fig. 3. The lower part consists of a horizontal plate, having attached to it a vertical tube, corresponding in form with the column which it serves to carry. The connection of the plate with this tube is strengthened by shoulders. The length of the whole of the base-plates being set north and south, in those through which roof-water is conducted, two sockets, issuing from the lower part of the tube, extend for some distance on each side in an opposite, or eastern and western direction. Into these sockets cast-iron pipes 6 inches in diameter are inserted, serving as drains to convey away the water; which, passing through the columns above, and through the hollow tubes of the base-plates, escapes into the pipes referred to, and finds its way to capacious drains situated in the centre, and at the extreme east-end of the building, which, in their turn, convey the water to the main sewer in the Kensington-road. At the upper portion of the tube of the base-plate, four projections with holes in them, are cast. At the foot of the column, which is of similar form to the base-plate, are similar projections, with corresponding holes. The upper face of the tube, and the under face of the column, being planed perfectly flat and true, the holes cast in the projections of the one exactly fit those cast to correspond with them in the other. Bolts having been then dropped through the holes in both are secured by nuts; and thus the column is attached to the base-plate, almost as rigidly as if the two had issued from one mould. As a proof of the singular accuracy with which the whole of these base-plates have been set upon their foundations, it may be mentioned that in every instance, the holes in the upper face or bearing surface of the base-plate, have precisely corresponded with those cast in the under face of the columns, at the exact height at which it had been pre-arranged that they should be fixed; and the two (columns and base-plates) have been united without involving the necessity of inserting any packing between them. Pieces of canvas only, cut to the exact form of the bearing surfaces, and dipped in white lead, have been interposed, with a view to insure the joints remaining perfectly secure and water-tight. The tops of the base-plates rise 3¾ inches above the ground-floor.

Those serving to convey away roof water;

How connected with columns.

Fig. 3.



Base Plate.

The columns

The columns are 8 inches in diameter, and those on the ground-floor are 18 feet 5¼ inches high. The plan or horizontal section of these columns, which was the suggestion of Mr. Barry, is well adapted for its purpose, mechanically as well as artistically; for while it presents a pleasing variation from the ordinary circular form, the different flat bands upon it afford surfaces well suited for the connection and attachment of the necessary girders, which serve at once to support the galleries and roof, and to tie the various compartments of the building into one vast network. The columns are made hollow, in order to convey the water from the roof of the building; and the thickness of the metal of which they are composed varies, according to the weight each column is intended to support, from ⅝ of an inch to 1⅛ inch. The square faces already mentioned add, however, considerably to the sectional area of the metal, upon the amount of which the strength of the column in a great measure depends.

Their strength;

The extraordinary strength to resist compression in the direction of its length, which the cylindrical form conveys to any material, was illustrated by Professor COWPER, in a lecture delivered by him in the building to the members of the Society of Arts. In a series of experiments with a common quill, and even with a straw, Professor COWPER demonstrated the great force required to crush such slight objects, and, arguing from their comparative scale, illustrated satisfactorily the great strength of the columns in the building.

Their attachment to connecting-pieces.

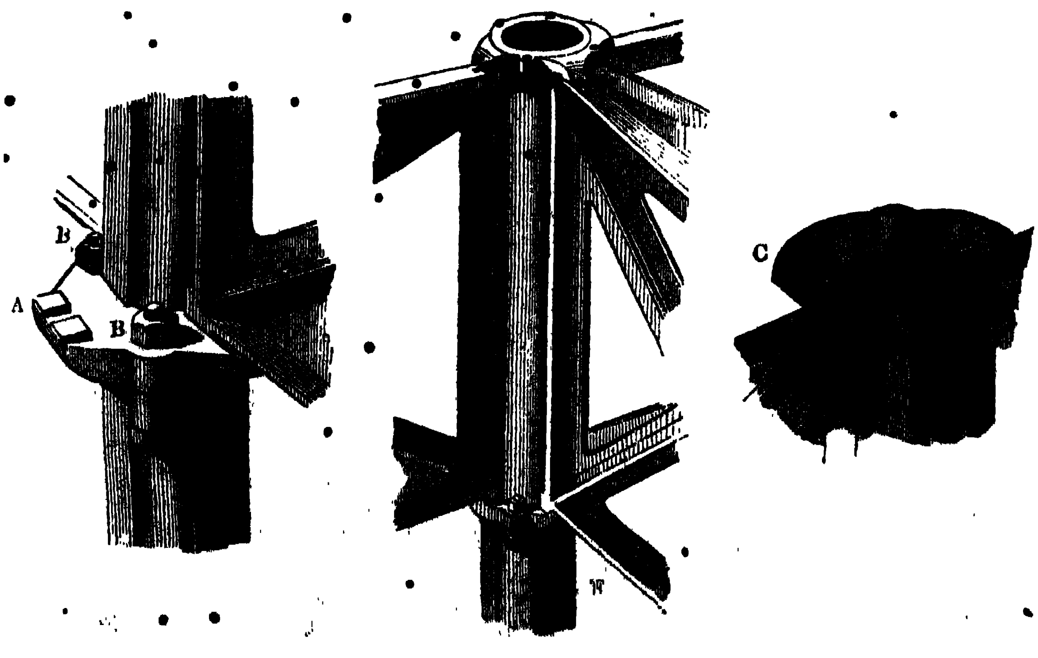
Beneath the capital, which surrounds the upper part of the column, are concealed projections similar to those at the bottom of the column. These projections serve to attach to the columns what have been technically designated as connecting-pieces. The peculiar office of the connecting-pieces is to afford, by a small and consequently easily modified casting, the means of securely retaining, and connecting in all directions, the various girders throughout the building.

The connecting-pieces;

The attachment to them of girders

In fig. 4, we have endeavoured to exhibit the peculiar formation of those portions of the connecting-pieces, which serve to effect the end desired. The projections, or, as they are technically termed, "snugs," are cast upon the upper and lower portions of the connecting-pieces, and act partly as brackets and partly as hooks, clutching over, supporting, and retaining, projections cast upon the ends of the standards of the girders. In order to retain the girders in a vertical position, and to prevent any lateral movement, the bottom face of that portion of the girder which rests upon the corresponding projection of the connecting-piece, is formed with what is called a tenon, which drops into a mortice-hole (A, fig. 4), cast in the face of the projection of the connecting-piece with which it comes in contact. The top face of the portion of the girder, over which the hook cast upon

Fig. 4.



the upper portion of the connecting-piece extends, has a groove sunk upon its surface; a groove corresponding to it in width is also sunk upon the projection of the connecting-piece (C, fig. 4), and a small piece of iron is introduced between the two. This iron acts as a key or dowel, and prevents the two surfaces sliding upon one another.

On the upper and lower part of the connecting-piece, between these projections which serve to retain the girders in their places, are cast holes, corresponding with those at the top of the lower columns, and at the bottom of the upper columns, through which bolts being inserted, nuts, (BB, fig. 4), fastened to those bolts, secure the columns and connecting-pieces together. A similar arrangement would enable any number of columns and connecting-pieces to be attached to one another, so as to make up one long length.

(thereby connected with columns)

In order to make sure that the shaft thus composed of alternate columns and connecting-pieces, should be capable of maintaining itself in a perfectly vertical position, it was necessary that the whole of the surfaces of contact should be wrought perfectly true and flat. Every column and every connecting piece had, therefore, to be placed in a lathe; and the bed or surface at each end faced to a perfectly true plane. When the number of these columns, base-plates, and connecting pieces is taken into consideration, it may be easily imagined that the labour entailed by this apparently simple necessity could scarcely have been performed in any workshops but those provided with extraordinary facilities and resources.

Serving to stiffen shafts, consisting of alternate columns and connecting-pieces.

All bearing faces planed in lathes.

In the connecting pieces of the 24-feet bay we are now describing, projections are cast upon three sides, so that girders may be attached in three directions; and thus extend in every direction except that towards the nave, and the 48-feet avenue or court on the other side.

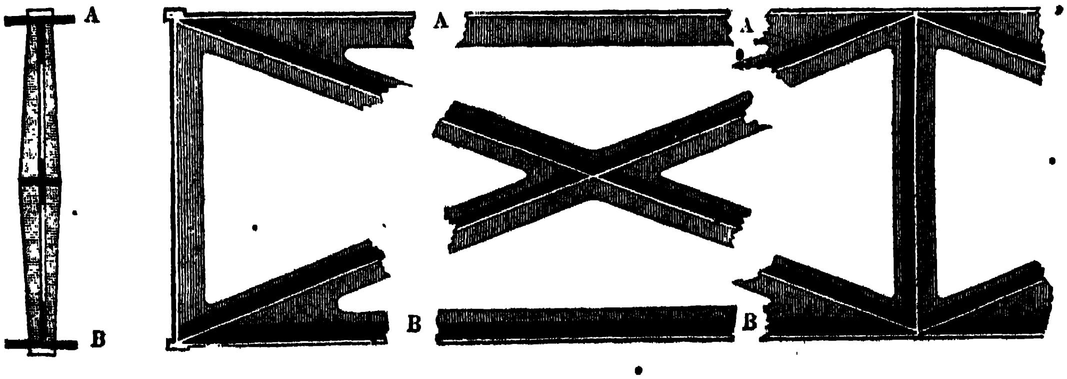
The girders, which are attached, as above described, to the connecting pieces, serve to support the gallery floor. As, in the construction of this floor, it had been determined to bring the accumulation of pressure on the girders, upon points at 8 feet intervals, it became necessary, in arranging the form of the girders, to concentrate strength at those points. The vertical lines of the girder have, therefore, been arranged to occur at intervals of 8 feet, connecting the top and bottom tables; on the good proportion of which, to the load to be supported, and to one another, the main strength of the whole depends. Diagonal lines connect the junction of these standards with the top and bottom tables, and the principal parts of the girder present the form shown in Fig. 5.

The girders supporting gallery floor;

The girders are 3 feet deep, and the sectional area of the top table, (A, fig. 5,) which is of the T form, equals 5·31 inches, and that of the bottom, (B, fig. 5,) which is of a similar shape, but inverted, equals 7·64 inches. The areas of

Their details;

Fig. 5.



the diagonal struts or standards, and ties, average 3·50 inches. The breaking-weight of the girders is calculated, and has been proved by various experiments, to amount to not less than 30 tons. Every one of the gallery-girders which has been used has been proved upon the ground to a strain of 15 tons; and, in exceptional cases, where it has appeared reasonable to expect that an accumulation of weight would have to be borne, their dimensions of thickness have been increased, and the amount of proof has amounted to no less than 22½ tons.

Their sufficiency to support a "dead weight,"

A few simple figures will clearly exhibit the sufficiency of these girders to support the loads that are likely to be brought upon them. A bay of gallery-floor, measuring 24 feet by 24 feet, contains 576 square feet; and it has been found by experiment, that it is impossible to load any surface with men to an amount equal to one hundred-weight per foot superficial. Assuming, then, 576 cwts., or say 30 tons, to be by any possibility accumulated upon such a bay of gallery-floor, the load will be distributed over four girders, any two of which have been found to be fully competent to support the load.

and a moving load. How tried :— By workmen;

In thus estimating the sufficiency of the girders, the load they might possibly be called on to support has been considered only as what is called "dead weight," or load to which no momentum of any kind had been imparted. In order, then, to test them under the action of a moving weight as well, a series of experiments was instituted. A perfect bay of gallery, 24 feet square, was constructed, with connecting pieces, girders, flooring, &c., complete. Its surface was first crowded with the contractors' workmen, as tight as they could be packed. The men were then set to walk over it, run over it, and, finally, to jump upon it with all their force.

By soldiers marching

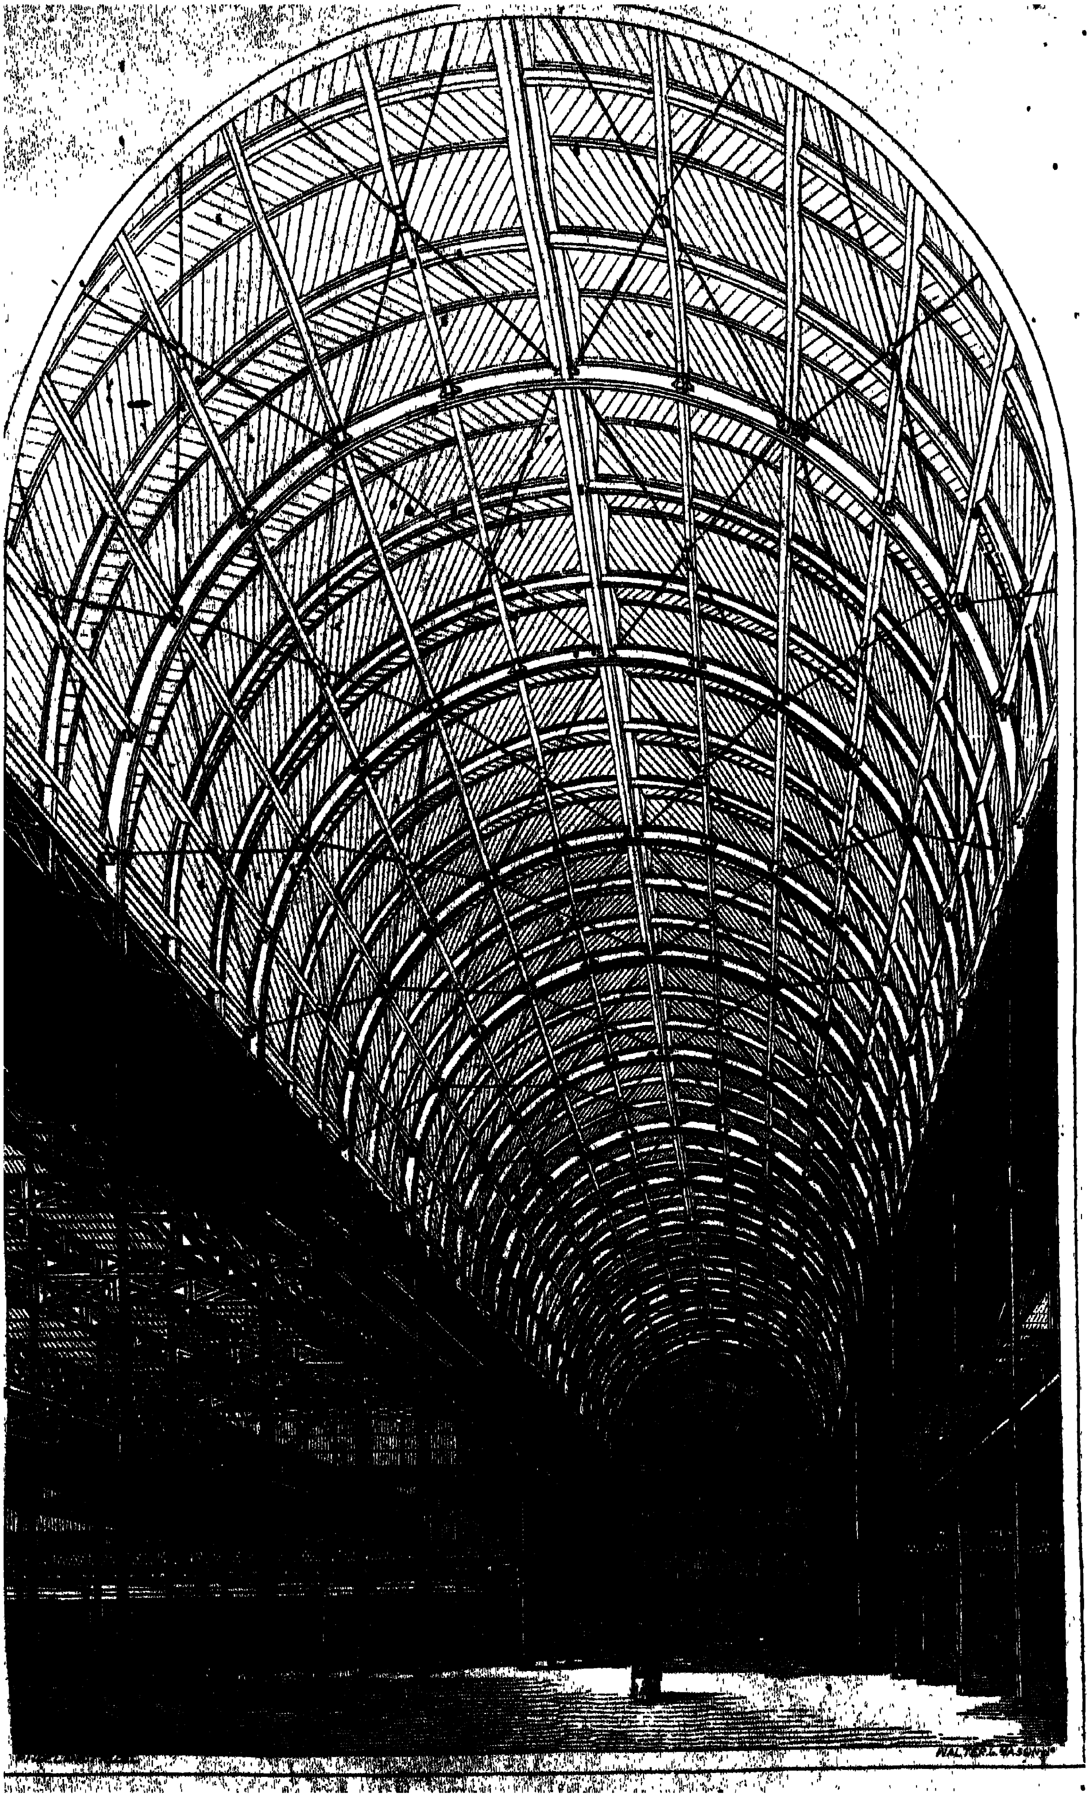
In order further to observe the effects which would be produced by a load to which a uniform, instead of an irregular motion, had been conveyed, a number of soldiers of the corps of Royal Sappers and Miners were ordered to march over it, to run over it, and, finally, to mark time upon it in the most trying manner. The result of these experiments developed the correctness of the theory upon which the dimensions of the girders had been based, since not the slightest damage was done to the bay of gallery; and the fact was fully evidenced, that the quality of elasticity or springiness in the floor served to protect the girders from the effect of sudden shocks, and prevented the danger of the communication to them of the accumulating momentum, generated by the possible isochronous movements of a crowd.

By rolling round-shot "in situ;"

Emboldened by the satisfactory result of these experiments, a yet more conclusive series was instituted. An apparatus was contrived by Mr. **Field**, the late President of the Institution of Civil Engineers, by means of which it was possible to draw, at a quick walking pace, over the whole of the galleries on which the public would have to tread, a number of 68-pounder shot, collected together so as to produce a uniform load of 100 lbs. per foot superficial. No damage whatever was produced by these rude tests, and they may be considered to have conclusively set at rest any doubts as to the sufficiency, in point of strength, of the gallery-floor, or of the girders which support it.

Who made by.

The whole of these girders are of cast-iron, and, together with the columns and similar castings, have been made in Staffordshire, at the foundries of the contractors, at the London Works, Smethwick, near Birmingham; at those of Messrs. A. and B. **Cochrane**, of the Woodside Iron Works, Dudley; and at those of Messrs. **Jobson's**, of Holly Hall, near the same town.



[illegible] VIEW OF THE INTERIOR OF THE BUILDING FROM THE SOUTH ENTRANCE. [*Plate* 1.; p. 57.

The gallery floor resting on the girders.

The floor, which is supported by these girders, consists of cross-beams, so under-trussed with iron rods, shoes, and struts, as to distribute the whole weight that may be brought upon the floor pretty equally upon the eight points at which the ends of the beams rest upon the girders. Joists, stretching from the iron girders to the beams, and from one of the beams to the other, form the supports for a floor which is not more than 1½ inch thick, but is at once amply strengthened, and rendered impervious to the passage of dust, by the insertion, in a groove cut in the edge of each floor-board, of iron hooping, forming a tongue. A railing, designed by Mr. OWEN JONES, surmounted by a mahogany handrail, adds at once to the utility and the beauty of the gallery.

The columns between galleries and roof.

The columns which rise at the gallery level are 10 feet 7½ inches long, and are surmounted by connecting pieces, similar in all respects to those occurring beneath. To these connecting pieces are attached, transversely in one direction and longitudinally in two, cast-iron girders of similar form and scantling to those we have described; their office being to maintain perfectly true and rigid, the vertical shafts which carry the eye upward in one unbroken line from the ground to the roof which they serve to support.

Strengthened by division into

First tier.

As the strength of an iron column practically depends upon its length being limited, far more than upon its substance, the value of dividing the whole length of the shafts reaching from the gallery to the roof into two parts by these connecting-pieces, and thus reducing the length of the columns one-half, must be readily appreciated.

Second tier.

Above the second tier of girders rise columns of the same length as those last mentioned, and on them again are placed connecting pieces, to which the girders supporting the roof are attached. These girders correspond with those supporting the galleries, and exactly resemble those forming the tier immediately beneath them, in every respect except their thicknesses. The whole of the girders on the upper tier have been proved in the building to a strain of nine tons.

Varieties of roof trusses.

By extending the area of our observations, we shall be enabled to include all the varieties of trusses employed to support the flat roofing over the whole extent of the building. It may be well, therefore, to consider that our original limitation to 24 feet square has been enlarged by the addition of a space of 72 feet by 24 feet, being a compartment of the roof over the nave; and of an area of the same *width* by 48 feet, being a portion of the roof over the avenue which extends from east to west, beyond the aisle on each side of the nave.

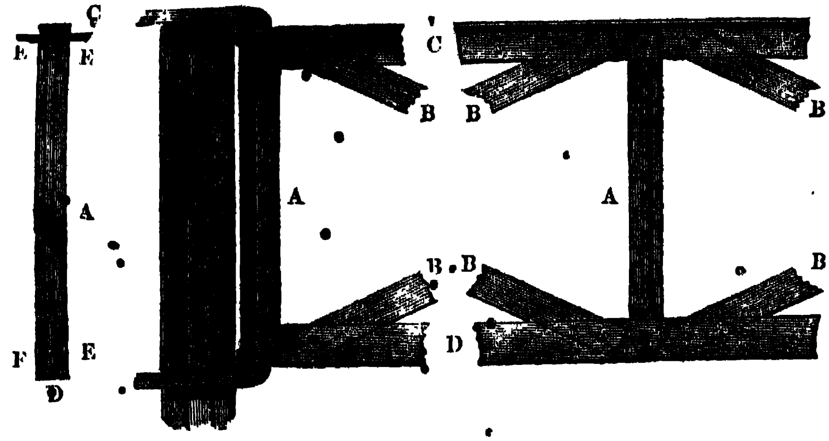
The 48-ft. trusses;

As we have stated that the latter of these portions of the building (the 48-feet avenue) rises to a height of two stories only from the ground, it will be manifest that its roof-trusses must be attached at the level of the girders which serve to stiffen the main shafts of the nave, namely, at a height of 44 feet from the ground. These 48-feet roof-trusses are attached to connecting pieces in a similar mode to that already described for the girders, with the exception that their vertical position is maintained by bolts passing through their standards and through the column, instead of by the system of keys as in the 24-feet girders.

Their details of construction.

In fig. 6 a representation is given of the principal parts of one of these trusses, which, it will be seen, is constructed for the most part of wrought iron; the few portions which are of cast iron acting only under compression. These trusses follow the general principle of division into 8-feet compartments; and, consequently, the cast-iron struts or standards (A A A A, fig. 6) occur in positions corresponding with those in the gallery-girders already described.

Fig. 6.



Diagonals of similar width on face (B B B B B B, fig. 6) connect them, and, consequently, an uniform lattice-like effect is obtained. The top table of these trusses (C C C, fig. 6) consists of two pieces of angle-iron, set at the distance of an inch apart, their total sectional area equalling 3 inches. The bottom table (D D D, fig. 6) consists of two bars of wrought-iron set at a similar distance apart, and increasing in sectional area up to 3·38 inches, as they approach the centre of the bearing. Between the angle-irons at the top and the bars at the bottom of the truss, are passed the ends of the cast-iron standards and those of the diagonal ties; the sectional area of the principal of the latter equalling 2·75 inches. Rivets, (E E E, fig. 6,) passing through the angle-irons and bars, the standards, and the ties, connect the whole into one truss, which acts upon the principle of a rigid top table under compression, and a suspension-truss beneath; so pressing up the standards or struts as to raise the centre of the upper table to a camber of 4 inches, one of the objects of which is to provide a sufficient fall for the roof-water. One of these 48 feet trusses, complete, weighs about 13 cwt., and when, under proof, having been loaded with a dead weight of 10 tons, deflected 3 inches, perfectly recovering its elasticity upon the removal of the weight.

The 72-ft truss;

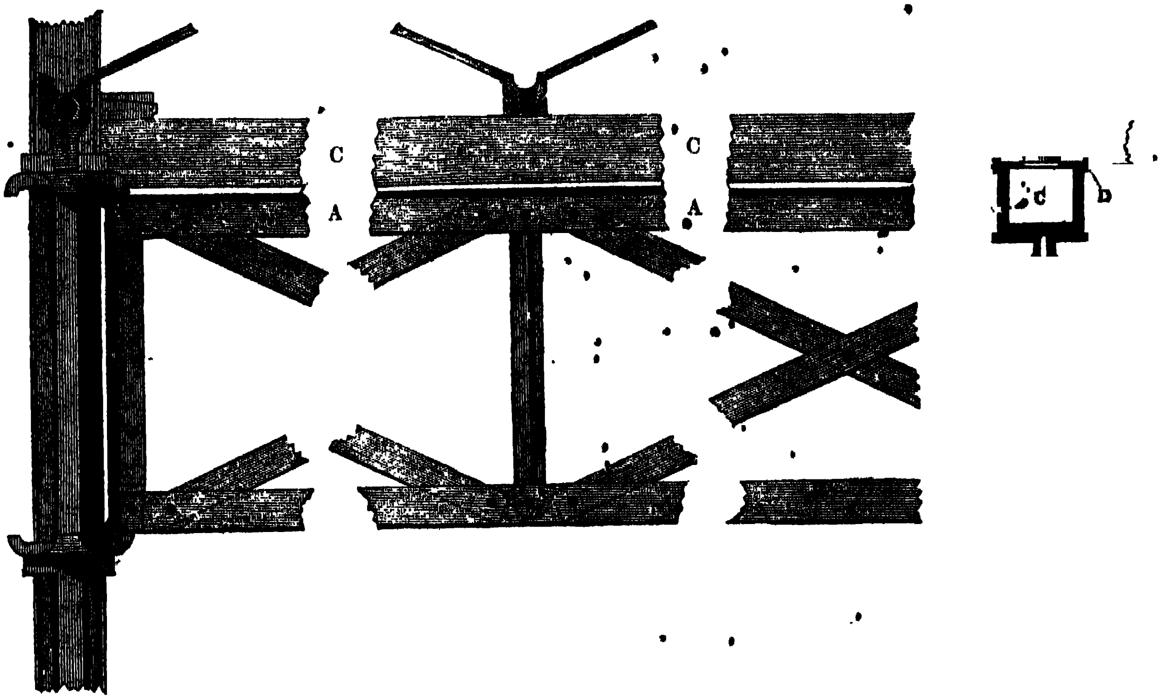
Their details of construction.

The clear width of the nave being 72 feet, it was of course imperative to construct a third description of truss, the depth of which should not exceed that of the connecting pieces generally throughout the building, namely, 3 feet, and yet sufficiently strong to support the larger weight of roof due to the increased area of roofing it was called upon to support. The construction of this larger truss, as shown in fig. 7, corresponds in every essential particular with that of the 48-feet truss already described, with the difference that the scantling of the angle-irons and bars is necessarily much increased, and that the total length of 72 feet is divided into *nine* 8 feet lengths instead of *six*. The weight of one of these trusses complete is about 35 cwts.; the sectional area of the two angle-irons (A A, fig. 7) being 5·71 inches; that of the two bottom bars, at their maximum, 6·75 inches; and that of the principal diagonal ties 3·38 inches. When loaded under proof, with a dead weight of 16 tons, it deflected 6¼ inches, and entirely recovered its elasticity on the weight being removed.

The extra strong 72-feet trusses; their details of construction.

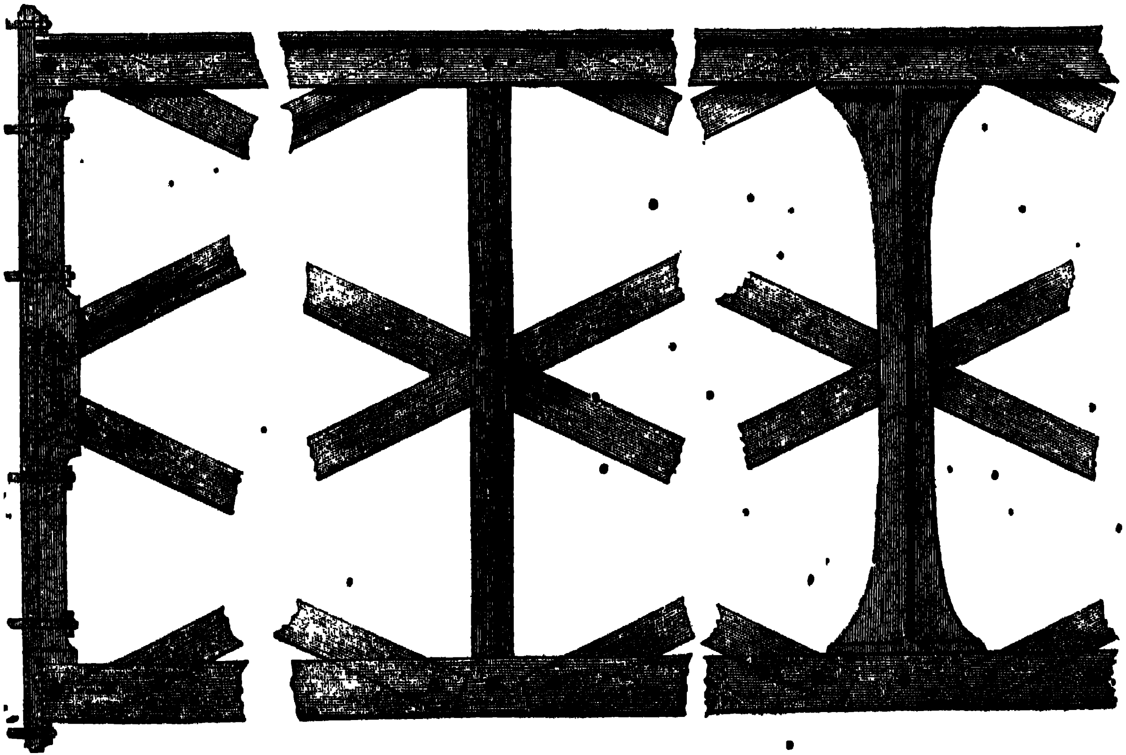
A repetition of one or other of these varieties of trusses suffices to support any portion of the flat roof of the building; but in order to carry the great extra weight thrown by the transept roof upon the last 72-feet trusses of the nave, where it intersects the transept, it was found necessary to employ trusses of double depth, extra lattice-work, and much increased scantling. The construction

Fig. 7.



of these trusses is shown in fig. 8. In order to give additional support to them, four extra columns have been attached to those situated at the intersection of the nave and transept.

Fig. 8.



The roof trusses, how connected longitudinally.

The direction of the 72-feet trusses of the roof of the nave being of course transverse to its length, and the trusses occurring at intervals of 24 feet, it became necessary, in order to perfectly steady them, that timbers (shown in section and elevation at BB, fig. 7) should be thrown across from one to the other, in the direction of from east to west. These timbers are introduced at intervals of eight feet, being placed directly over the vertical standards of the roof trusses.

Box-gutters running transversely over trusses,

Between the top of the truss and the end of these timbers is placed a box (shown in section and elevation at C C C, fig. 7), running along the whole length, and attached to the upper flange of the truss, forming a gutter of considerable capacity, for the purpose of carrying the water away from the roofs to the hollow columns, through which it ultimately descends to the drains.

Connected longitudinally by Paxton gutters, &c.

The peculiar form of the timbers, spanning from truss to truss, and the offices they are called upon to perform, together with the fact that no less than 20 miles of them are required for the construction of the roofing, render them worthy of a detailed description. They are now known as the *Paxton gutters.* The form of their section is clearly shown in fig. 9.

Figs. 9, 10, 11, 12.

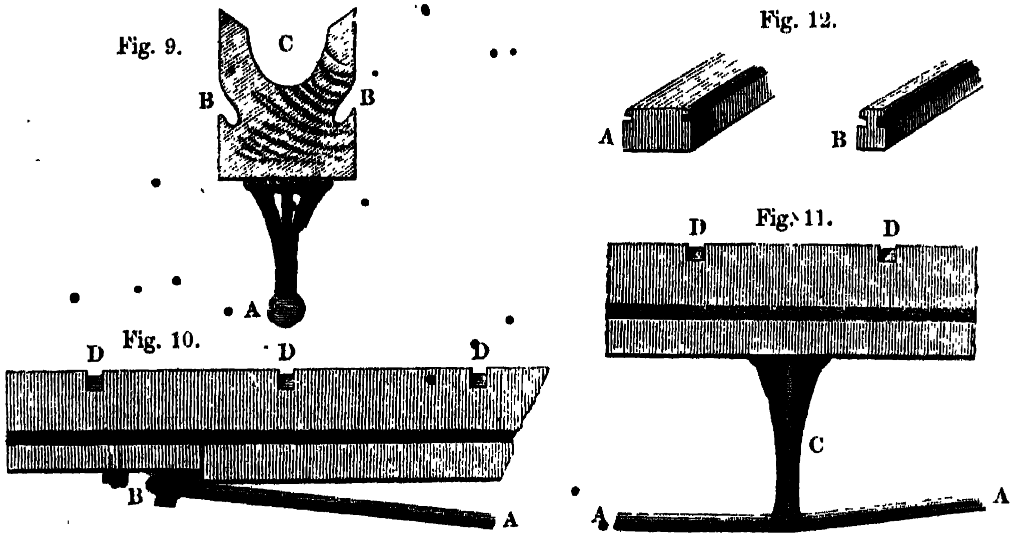


Fig. 9.

Fig. 10.

Fig. 11.

Fig. 12.

The Paxton gutters;

Their details of construction;

They consist of pieces of timber 24 feet in length, five inches wide by six inches deep. On the upper surface, a semicircular groove (C, fig. 9), 1$\frac{3}{8}$th inch radius, is cut, in order to receive the external water from the roofs. On each of the two vertical sides of the timbers an oblique groove (B B, fig. 9) is cut, in order to receive the condensed water, which, trickling down the inner surface of the glass, finds its way to these small channels, and is carried along them to their ends, where oblique cuts connect them with the box-gutters.

Their trussing;

As the length of 24 feet would be too great for the gutter to carry itself without bending, or, as it is technically termed, "sagging," the alternative presented itself of either very much increasing the scantling, or contriving some system of trussing. The former was rejected on account of its heaviness and unsightly appearance; it was therefore determined that a rod of iron (shown at A A A A, figs. 9, 10, and 11) should be passed beneath the Paxton gutter, should be secured to its two ends by cast-iron shoes (B, fig. 10), and should press up, at eight feet intervals in its length, two cast-iron standards (C, fig. 11), so as to effect a camber or rise in its whole length of 2½ inches. So trussed, the gutter is capable of supporting no less a weight than 1½ tons. A semicircular cut is given through the depth of the gutter at both ends, so that when two are placed end to end, the water may flow down to the box-gutters through a circular cavity. Twenty-seven notches are marked by a template, and cut on each side of the upper edge; a few of these are shown at D D D, figs. 10 and 11. The Paxton gutter, thus complete, is attached to a flanged iron plate, bolted on to the edges of the box-gutters, so that the parallel lines of gutter may form a continuous tie from the eastern or western ends of the Building to the transept, and so that, should the wood shrink in length, it may not pull apart and distort the sides of the box-gutters.

Their connection with the roofing;

Three of the notches referred to as being cut on each side of the gutters, are larger than the others, and on them bars of wood, 2 inches by 1¼ inch, grooved for glass on both sides, are notched down. These bars (shown at A, fig. 12) form principal rafters, and, being set at a pitch of 2½ to 1, are fixed to a ridge 3 inches by 3 inches, grooved for glass on both sides. The angle at which these are fixed being the one which Mr. PAXTON, in numerous experiments, has found to be best adapted to the construction of similar roofs.

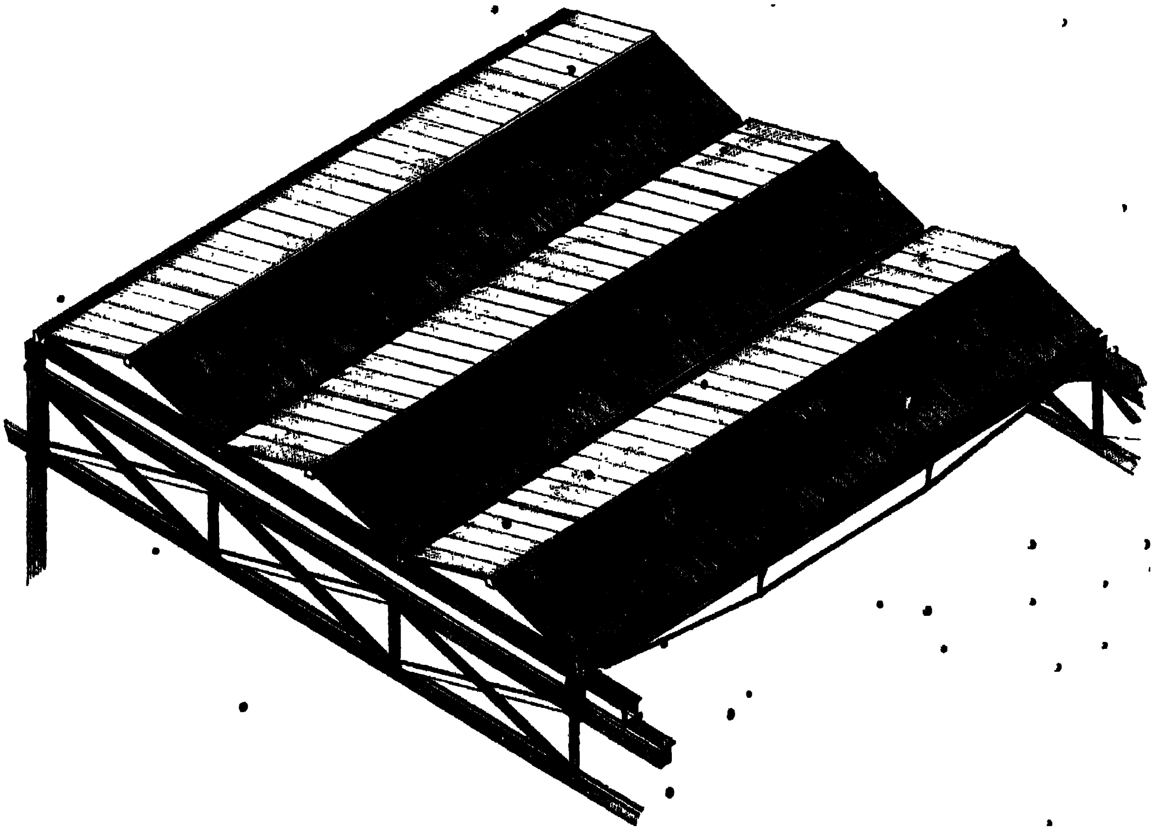
Reasons for fixing their pitch at 8 feet.

One of the principal reasons which led to the adoption of eight feet and not more, as the pitch of these gutters from centre to centre, was, that the distance from ridge to gutter-edge might be covered with the largest sized glass that could be conveniently manufactured in one length, and that by that means the unsightly appearance, and frequently leaky condition, of joined glass, might be avoided.

A 24-feet bay of roofing;

The method of construction of a 24-feet bay of this system of roofing is shown in fig. 13, and from it the reader may be enabled to follow the description we are about to give of the construction of a length of roofing.

Fig. 13.



How constructed.

The gutters, principal rafters or main sash-bars, and ridge being fixed in place, the long edge of a sheet of glass, 4 feet 1 inch, by 10 inches, is inserted into the groove of the principal rafter, and a sash-bar (shown in section at B, fig. 12), 1 inch by 1½ inch, also double grooved, is then put on to the other long edge of the glass. The sash bar is then brought down and secured at the top to the ridge, and at the bottom to the edge of the gutter; the lower edge of the glass bedding on putty about three-quarters of an inch wide. A slight blow to the lower end brings the upper edge of the glass home into the groove in the ridge. The glass being then pressed down, the putty is made good in the grooves externally, and by the repetition of this simple operation, the essentials of this system of roofing are constructed.

Lightness one of the advantages of Mr. Paxton's roofing.

One among the many advantages of Mr. PAXTON'S roofing is its extreme lightness. In the instance of that of the Exhibition Building, the whole of the roofing (the weight of the trusses that support it being of course deducted), weighs only 3¼ lbs. per foot superficial upon the average.

The canvas covering, how attached.

Its uses

In order to mitigate the intensity of the light, and at the same time to assist in keeping the building cool, a canvas covering has been provided, extending over the entire area of the flat roof. The canvas is attached to the ridges, and allowed to hang down between them in a festoon. As one width of canvas is insufficient to reach from ridge to ridge, two are sewn together, the seam occurring in the centre, immediately over the Paxton gutter. The rain descending falls on the canvas, and clings to it by capillary attraction, creeping down until it arrives at the seam, where it passes through the canvas, and falls into the Paxton gutter; thus the danger of the passage of water which might take place through broken panes or imperfect putty-joints, is obviated, and the chances of leakage are consequently materially diminished.

The flooring,

In order to trace continuously the course of the vertical supports from the ground to the roof, we have not interrupted our description by detailing the nature of the flooring; but as that is one of Mr. PAXTON'S ingenious contrivances, it would not be right to allow it to pass unnoticed. In a paper, read by Mr. PAXTON at the Society of Arts, on the 13th of November, 1850, that gentleman narrated the experiments which led to the origination of the present design, and stated that he had tried many methods, in order to find out the most suitable floors for the pathways of horticultural structures. After enumerating the objections to the use of stone and close boarding, he mentioned, that "he had ultimately been led to the adoption of trelliced wooden pathways, "with spaces between each board, through which, on sweeping, the dust at once "disappears, and falls into the vacuity below." He thus describes his application of these experiments to the Exhibition Building:—

as described by Mr. Paxton.

"Whilst the accomplishment of this point" (the speedy removal of dust) "was most important in plant-houses, I consider it doubly so with respect to the "Industrial Building, where there will be such an accumulation of articles of "delicate workmanship. Before sweeping the floors of the Great Building, the "whole will be sprinkled with water from a movable hand-engine, which will be "immediately followed by a sweeping-machine, consisting of many brooms, fixed "to an apparatus on light wheels, and drawn by a shaft. By this means a large "portion of ground will be passed over in a very short space of time." The boards for the floor are 1¼ inch thick, laid half an inch apart, upon joists 7 inches by 2½ inches, which rest upon large timbers or sleepers, 13 inches by 3½ inches, at intervals of 8 feet apart. Through the interstices left between the boards the dust passes, and the merits of this system of flooring are thus summed up by Mr. PAXTON:—"It is very economical, dry, clean, pleasant to walk upon, admits "of the dust falling through the spaces, and even when it requires to be

Conclusion of notice of general construction of one 24-feet bay.

"thoroughly washed, the water at once disappears between the openings, and the "boards become almost immediately fit for visitors."

General dimensions and quantities.

Having now endeavoured to furnish the reader with sufficient detail of a small portion of the building, to enable him to use it as a scale, whereby to estimate the quantity of labour represented by a structure of the general dimensions we are about to enumerate, it may be stated that the total area of the ground floor is 772,784 square feet, and that of the galleries 217,100 square feet. The galleries extend nearly a mile in length. The total cubic contents of the building are about 33,000,000 feet; there are nearly 2,300 cast-iron girders, and 358 wrought-iron trusses for supporting the galleries and roof, 30 miles of gutters for carrying water to the columns, 202 miles of sash bars, and 900,000 superficial feet of glass. The width of the nave is, within 10 feet, double that of St. Paul's Cathedral, whilst its length is more than four times as great.

The transept.

Its roof.

With a general knowledge of the construction of the nave, we may imagine the visitor, returning to the transept, better qualified to enter into the mechanical details, and the amount of difficulties presented to his notice, by that great feature of the building. The arrangement of the vertical shafts, galleries, &c., is similar to that of the nave; the main points of difference commencing at the level of the flat roof. It will be remembered that the spaces to be covered at a height of 64 feet from the ground, are, firstly, a main avenue, 408 feet long by 72 feet wide; and secondly, two aisles, each 408 feet long by 24 feet wide. It was determined that a semi-cylindrical vault should span the larger of these areas, and for that purpose semicircular ribs (see Plate I.) extend from side to side, their ends being inserted into the hollow columns, whilst they are steadied by the insertion between, and at right angles to them, of stout timbers, 9 feet 2 inches from one another, acting as purlins.

Construction of the ribs of the transept roof.

Description quoted from "Transactions of Institution of Civil Engineers."

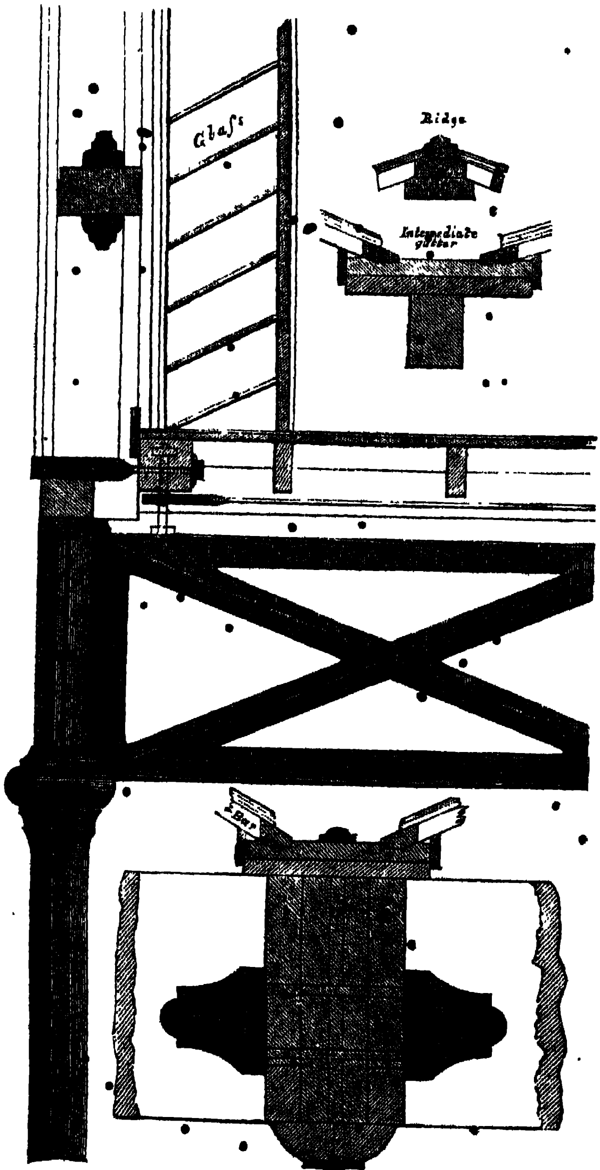
The structure of the ribs is shown in fig. 14. To quote from a paper descriptive of the building, read at the Institution of Civil Engineers, on the 14th of January, 1851, "they are made in three thicknesses of timber, cut into segments, "9 feet 6 inches long, of a circle of 74 feet extreme diameter, the centre thickness "being 4 inches by 13½ inches, and the outer, or flitches, breaking joint with the "centre, being 2 inches by 13½ inches. The flitches are nailed to the centre "thickness, and ⅝ths inch bolts, about 4 feet apart, on the segment, traverse and "bind together the three thicknesses. On the extrados, or outer circum-"ference of the wooden arch thus formed, two planks serving as a gutter board "11 inches by 1 inch, and a bar of iron 2 inches by ⅜ths inch, are bent to the "curve; and on the intrados, or inner circumference, a piece of timber, 7 inches "by 2 inches, moulded to correspond with the form of the columns, and a bar of "iron, 3½ inches by ⅜ths inch, are also bent to the curve. Bolts, at intervals "of 2 feet from centre to centre, passed through the depth of the rib, unite these "additions to each other, and to the main rib, which, thus increased in scantling, "measures, complete, 1 foot 6 inches by 8 inches." In order to perfectly connect these ribs, so that any force exerted, by wind or other causes, tending to the displacement of any one of them, may be distributed over the whole mass, iron rods have been set diagonally, forming a complete reticulation over the whole inner surface of the roof. The main ribs are fixed spanning the transept, at intervals of 24 feet from centre to centre. Each of these 24 feet widths is divided into three parts, and at 8 feet from one another, and from the main ribs, minor ribs are introduced. Between them again, but being semicircles of larger

The transept roof, how constructed.

diameter, are fixed small ribs of wood, which being connected with the main and minor ribs by means of sash bars, become available as ridges. The space between them and the ribs is glazed and finished on the same system as that adopted in the flat roof of the building, the sash bars being set at an oblique angle, or "herring-bone" fashion, in order to assist the conduction of the water, and prevent its lodging against the lower putty bed of each pane of glass over which it trickles.

Fig. 14.

Transept Ribs



Section of Transept Rib, and springing of ditto.

The lead flats.

Along the summit of this semi-cylindrical vault runs, from north to south, a narrow lead path, in order to afford access to the apex of the roof, and to provide a means of lowering down workmen to repair any damage that may possibly happen to it. As the quantity of water discharged from this vault must necessarily be considerable, it was deemed advisable that the 24-feet aisles on each side of it should be covered with lead flats, instead of the ordinary glass roofing. These lead flats presented also the further advantage of being so completely connected, as to form solid abutments, steadying the feet of the ribs. In order to convey any pressure in the way of thrust, that the ribs might exert, to those points best capable of resisting strain, horizontal trusses of wrought-iron were constructed beneath the lead flats, consisting of bars capable of being keyed up at any time from the lead flats, and thus any tendency to movement, on the part of any of the ribs, would be immediately transferred either to the extreme north and south ends, where their feet are securely tied together by the cast-iron girders which cross the transept at those points; or to the angles where the transept intersects the nave, and where the whole force of the *vis inertiæ* of the nave roof would serve as abutment.

The general effect produced by this semi-cylindrical roof covering the large elms beneath, is shown in Plate I.

The external enclosures.

The external enclosures or walls, as seen from within, on the two upper stories, consist of glass in wooden sash frames, inserted between columns 8 feet from centre to centre, and louvre frames for ventilation, surmounting the sash frames. On the ground story, boarding takes the place of the glass; and the height being 24 feet instead of 20 feet, an additional tier of ventilators is inserted. The columns at 24 feet apart being of iron, the intermediate ones, dividing that width into 8 feet compartments, are of wood.

The sash-frames.

As no less than 1,500 sash frames have been used, they may justify a few words of description. To quote again from the Transactions of the Institution of Civil Engineers, we learn that "the sash frames are 2½ inches thick, with seven bars in their width; the bars being 2⅜ inches deep, double grooved for glass. Wrought-iron bolts, ⅜ inch diameter, pass completely through the sash bars and sash frames, at the points where they are attached to the columns; and thus a chain tie is kept up all round the building, in order to prevent displacement of the sashes either bodily or in portions, by the pressure of the wind. To further guard against the same action, timber bridges, 3½ inches by 1½ inch in the centre, are fixed across the middle of the length of the sash; and at the internal angles, where the wind will exert its greatest force, iron rods, half an inch in diameter, are fastened from column to column, pressing against the wooden bridge, and converting it into a continuous strut, bearing up against any force applied to the exterior of the sash. In order to glaze the sashes, the glass is slipped down between the bars, and provision is made for mending, by causing one groove to be cut deeper than the other, so that the glass may be slipped in from one side, and puttied into its exact place. A similar provision is made for mending the roof glass."

The action of wind on them, and on the building.

As whatever lateral force the wind may exert upon the building will be principally received by these sashes, it may not be inappropriate, in considering them, to advert briefly to the general question of the action of wind upon the building.

On the 15th of January, 1851, a meeting was held at the Society of Arts, at which Mr. Fox, one of the contractors for the building attended, to afford the members of that Society an opportunity of asking any questions as to the general points of stability and durability, on which they might desire information. One of the questions proposed was, "What would be the effects of the wind on such an extensive surface as the building presented, and what means were taken to counteract them?" and as Mr. Fox's reply embraced with remarkable clearness the principal facts connected with the argument, we shall give it at length. Mr. Fox replied "that the building rested on 1,060 columns on the ground floor, and the most likely direction for the wind to have any injurious effect on the building, must of course be in the direction of its greatest width, which was 1,800 feet as compared with 400 in the opposite direction. These columns rested on cast-iron plates based upon concrete; and there was no possibility of their rocking about without the base-plates being broken. Above these plates were sleepers, that carry the floor. They were 13 inches in depth, and fitted accurately up against the two sides of the column, and running transversely from one side of the building to the other; so that it would be very difficult to conceive that one of these columns could be possibly upset until it was actually broken in two. And again, at the top the columns are united together by cast-iron girders 3 feet deep, and four columns are framed together, very much as they would frame a table. Now to break the column,

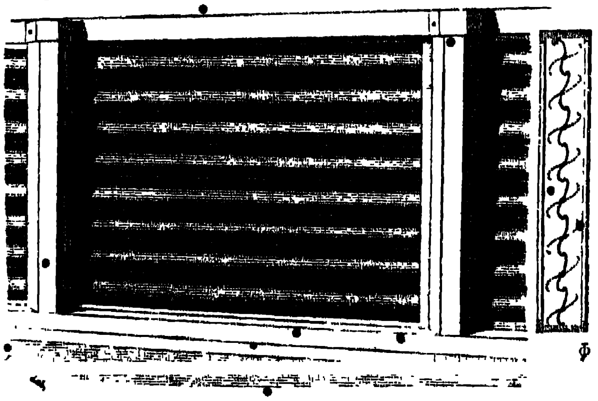
How described by Mr. Fox.

" they must exert a force equal to that of twice the transverse strength of the
" column. According to the experiments it was found that six tons was the
" bearing weight, and 12 tons the breaking weight of the columns in the centre.
" Now, 1,060 columns multiplied by six tons, the bearing weight, was equal to
" 6,360 tons; so that it would be necessary to exert a force equal to 6,360 tons,
" at a height of 24 feet from the ground, before they would be able to blow down
" the building, and he was now treating of the building independently of its
" bracings. The greatest force of wind ever known had been computed at 22 lbs.
" to the superficial foot. Taking 28 lbs. as the force, and assuming that they
" could have a gust of wind which would strike the whole side of the building
" from top to bottom at the same moment, the total force which could be brought
" against it would be from 1,400 to 1,500 tons. Now, they had got power to
" resist it of 6,360 tons, not taking into account the bracings and the other con-
" structions and offices which were within the building, and which must of
" course add to its strength. The building had been tested in the late gale, when
" Colonel Reid ascertained that the force of the wind was 19½ lbs., and it did
" no harm whatever; and that was at a time when the roof was not on, and the
" building was quite exposed."

The ventilators.

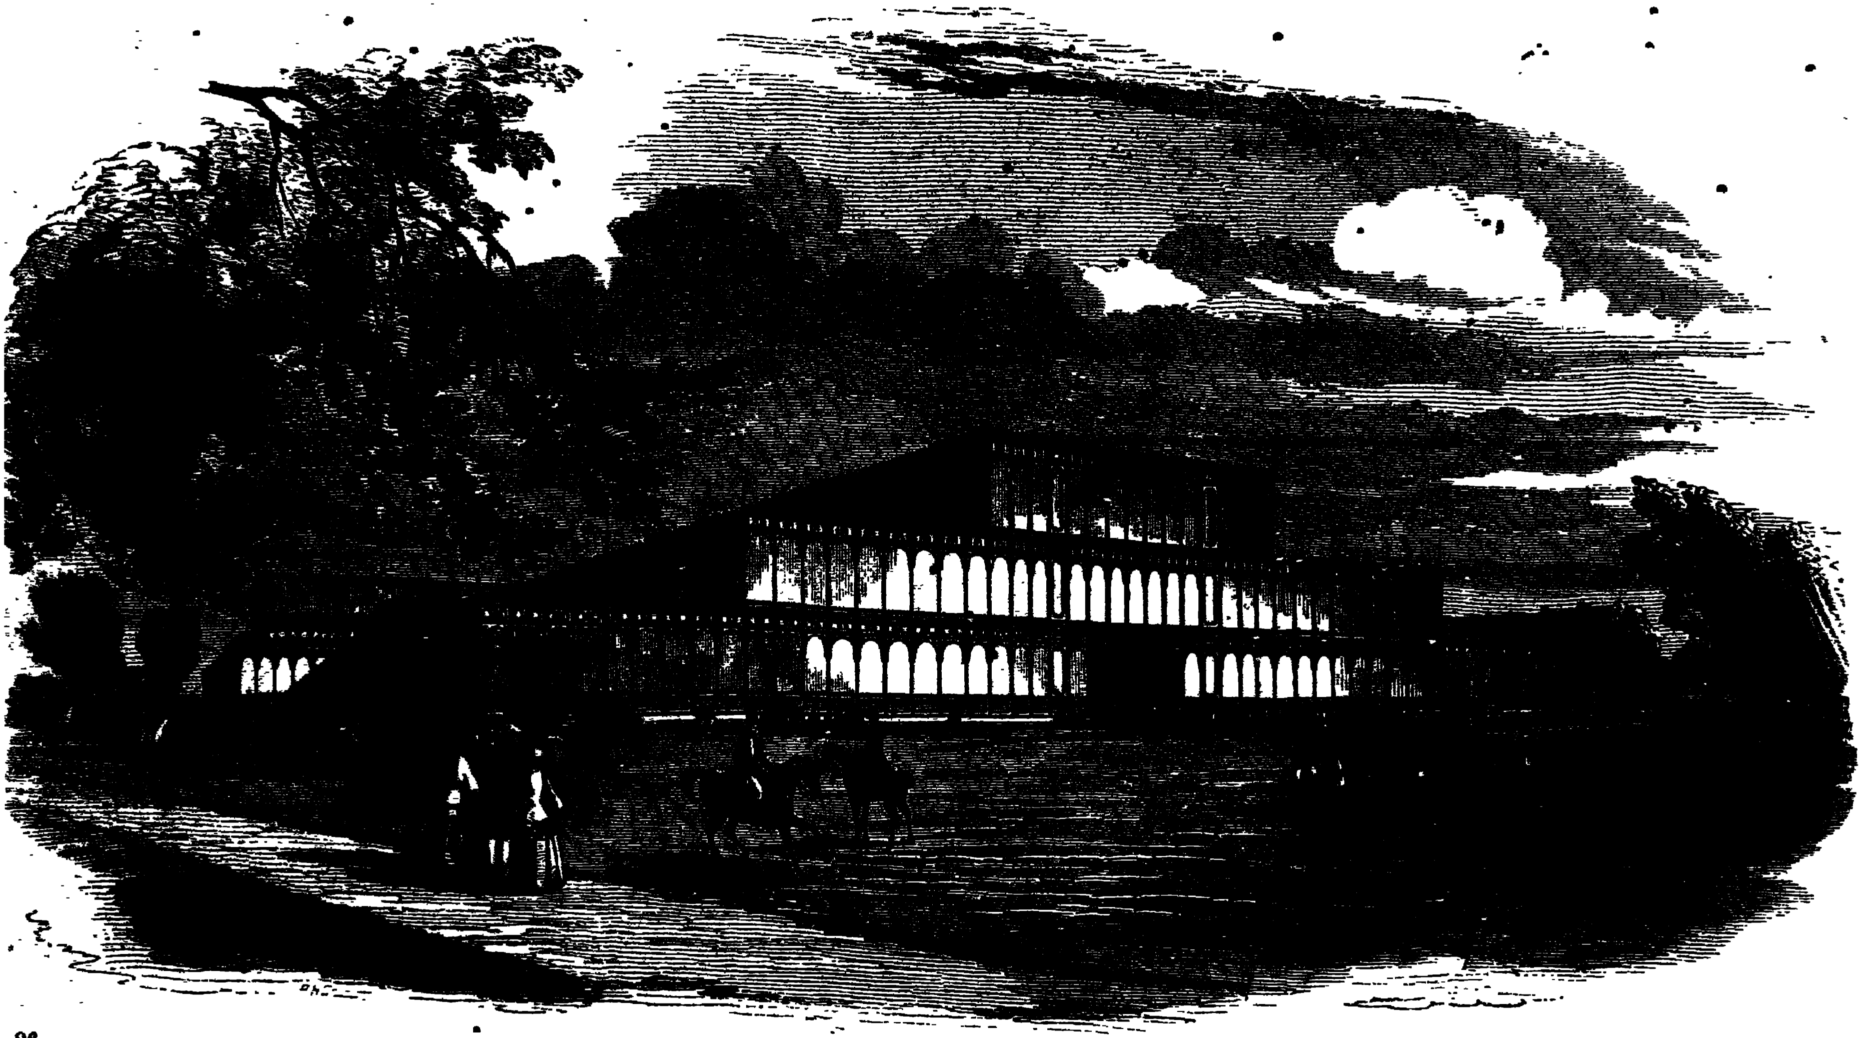
The ventilators, to which allusion has been made, and which are shown in fig. 15, fulfil an important office in the building, acting as the organs of respiration to the whole body. The total surface of ventilation is nearly 50,000 superficial feet, and the whole has been so arranged, that, by the application of one man's strength, at about 90 different points, the whole may be opened, closed, or set and secured at any desired angle, simultaneously. The ventilators themselves consist of galvanized iron blades of an S form, 6½ inches wide, fixed on pivots at 6 inches from centre to centre. Of these there are eight in the wooden frame inserted between the columns and the sill on the ground floor, and six in those which surmount the sash-frames on the two upper stories. The section of the blade is of a novel form, and is calculated, when open, to afford the minimum interruption to the passage of the air, compatible with being weather-tight at all times. To each blade, in the centre of its length, are attached small iron brackets furnished with eyes, through which pins are inserted; which pins are secured in a species of wooden rack. These racks are connected with cranks attached to iron rods, to which a movement of torsion is conveyed by screws and powerful levers. A moderate exertion of the strength of one man applied to one of these levers, suffices to regulate, with facility, no less than 600 feet superficial of ventilation.

Fig. 15.



The decoration.

Hitherto the building has been considered only in a structural point of view. The vivacity of any impression it may convey to the casual visitor will, however, probably depend more strongly on the system of decoration which it has received from Mr. Owen Jones than on any of the constructional details we have been describing. That gentleman, whose studies in Egypt and in the East generally,



26. [Fig. 16, p. 67.

VIEW OF THE EXTERIOR OF THE BUILDING FROM THE NORTH-WEST ANGLE.

in Spain, and in other countries of Europe, had qualified him for the task, was enabled at an early stage in the progress of the building, to foresee the effect of the combination in perspective of its various lines. Serious apprehensions were at first entertained as to the propriety of the application of colour, usually devoted to the decoration of extended surfaces, to what were asserted to be lines only. Mr. JONES was, however, enabled to estimate how far the merging in distance of these lines would give them the appearance of surfaces, and the three tints of blue, red, and yellow have been distributed by him over the columns and girders, so that as the surfaces blended in perspective, each column has allied itself in colour with its fellow column, each vertical face of girder with the vertical faces of its fellow girders, and each soffite, or underside, with its fellow soffites. Breadth and distinctness were given to the enunciation of each colour. The light of the sky appearing through the interstices of the roof, the principal portions of which have been tinted of a delicate blue, unites with the colour, giving it at once air and brilliancy. The effect of this mode of treatment has been to add considerably to the apparent elevation of the building. By varying the colours of the vertical and of the horizontal lines, and retaining each uniformly, the eye is enabled to detect, at even the greatest distance, the direction and position of every part of the construction, and thus the otherwise endless confusion of the complexity of lines, is reduced to order and simplicity.

The refreshment rooms, &c.

Although a provision for the gratification of the intellectual tastes of the visitor has been the main object in the formation of the Exhibition Building, ministering to his more ordinary appetites has not been lost sight of. Commodious refreshment rooms, with the accompaniments usually connected with them at large railway stations, have been provided around the trees at the northern extremity of the transept, and adjoining open courts towards the eastern and western extremities of the buildings, where the presence of the trees dictated their location.

The offices.

The official business connected with the conduct of the Exhibition rendered necessary the employment of a large staff of clerks, &c., for whom, and for the juries, &c., a considerable extent of accommodation has been provided in offices placed on each side of the southern entrance.

The entrances and exits.

We have supposed our visitor to enter on the south side; admittance may, however, be also gained at the eastern and western ends, where similar vestibules, 72 feet by 48 feet, afford accommodation for turnstiles, check-takers, &c. Disposed at nearly equal distances from one another, on the four sides of the structure, are 15 exits, by passing through either of which the building may be quitted.

The exterior of the building.

In issuing from its precincts the visitor will pass through the gates of an iron railing designed by Mr. OWEN JONES. Retreating to some distance, he will be enabled to take in a general impression of the whole building, as shown in fig. 16. From the north-west angle the most picturesque view is to be obtained, and from that position may be best appreciated the grand effect produced by Mr. PAXTON'S happy idea of raising the semi-cylindrical vault of the transept roof, above the tiers of terraces which extend on either side of it. For much of the grace of proportion and beauty of form, which from this point of view the visitor cannot fail to notice, the building is indebted to Mr. BARRY. Upon the form and distribution of the arches and filling-in frames, as well as of the columns, the suggestions of that gentleman exercised a happy influence.

The details of an 8-feet bay of elevation.

In fig. 17 we have given a view of a bay of the building, 8 feet in width; and from that and the other illustrations a tolerably correct idea may be formed of the nature of its external construction.

The spaces enclosed at eastern and western ends.

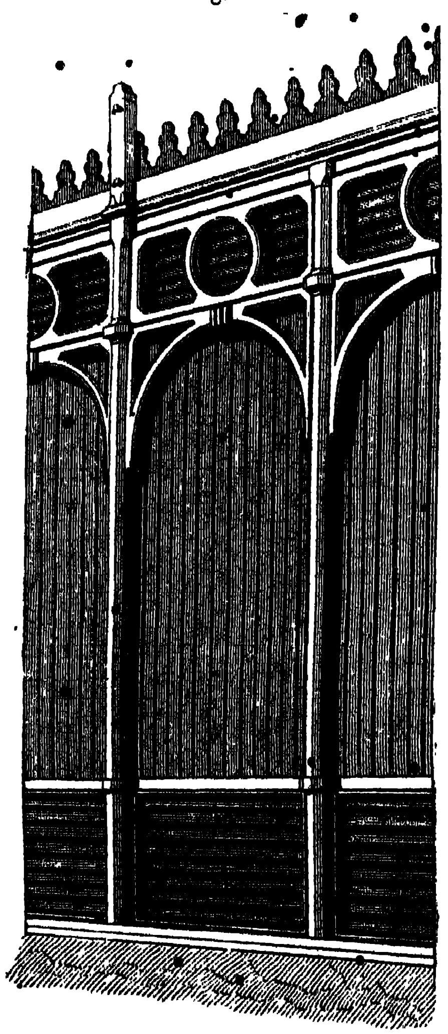
At the east and west ends considerable spaces have been enclosed, for the purpose of affording accommodation for large objects, the weight or dimensions of which precluded their admittance into the building.

The boiler-house.

The water supply.

At about 155 feet from the north-west angle, a structure, 96 feet by 24 feet, has been erected for the purpose of containing the boilers for generating steam, to be supplied to give motion to the various machines requiring to be exhibited in operation. The external appearance of this building precisely corresponds with that of a portion of the main edifice of similar dimensions. It contains five boilers, equal to 150-horse power, and a large tank, serving as a balance-head to the water-supply. This supply consists of a 6-inch main, entirely surrounding the building; upon it, at intervals of about 240 feet, are placed fire-cocks; and at different points in its circuit 16 4-inch branch-pipes enter the building, and lead so far into the interior, that fire-cocks placed upon their ends are so situated that circles of 120 feet radius drawn from each of them would intersect one another. The mains running on the north and south sides of the building are connected across the transept by a 5-inch main, from which, near the centre of the building, pipes diverge, leading east and west, for the supply of the various fountains placed upon the central line of the nave.

Fig. 17.



Conclusion of Part I. of subjects—"The building as it stands." Commencement of Part II.—"Its creation."

Having endeavoured to convey some general idea of the nature of the building as it at present stands, it may be desirable to trace the successive steps by which it has grown into the form it now assumes.

Arrangements subsequently to acceptance of tender.

When it is remembered that the tender for its construction was not accepted by the Royal Commissioners until the 26th of July, 1850, that possession of the site was only obtained on the 30th of the same month, and that the first column was fixed on the 26th of September, it will be manifest that into the intervening period must have been crowded arrangements, which, under ordinary circumstances, would have required at least double that period for their completion. Details of construction had to be settled, elaborate calculations as to the strength and proportions of the several constituent parts to be made, machines for economising labour to be devised, contracts for the supply of materials to be entered into, and thousands of hands set actually to work. How unintermitting since that period the labour must have been is testified by the fact, that the opening of the Exhibition takes place on the 1st of May, the day originally appointed.

Hoarding commenced on site being given up to contractors.

On the ground being given up to the contractors, the first work undertaken was the construction of a hoarding to inclose the whole area of the site. This hoarding was formed by the insertion into the ground, in pairs, of the timbers ultimately to be used as joists. Between each pair of uprights were slipped the ends of boards, ultimately to be used as floor-boards; and these were secured by attaching together the two ends of the joists extending above them. Thus the expense of the hire of waste boarding was avoided; the timber composing the hoarding was completely uninjured; and the celerity with which the whole area was surrounded was truly remarkable.

The setting out.

The task of setting out the plan of the building was intrusted to Mr. Brounger; and the extreme accuracy with which the situation of every column was fixed, and the adjustment of every level was performed, reflects credit upon that gentleman.

How proceeded with.

In order that the measurement of 24 feet, upon which the accuracy of the whole plan depended, might be indicated with extreme precision, poles of thoroughly-seasoned pine were fitted with gun-metal cheeks, or small projecting plates, the ends of the poles extending a few inches beyond the cheeks. The measurements were taken by laying one pole on the other, so that the inner edges of the gun-metal cheeks, set at precisely 24 feet from one another, might be brought into contact. Thus the danger of any error, arising from the ends of the poles becoming damaged in use, was avoided. Stakes having been driven into the ground to indicate approximately the position of the columns, their precise centres were ascertained by the use of the theodolite, and marked by driving a nail into each stake at the exact point. When it became necessary to remove these stakes, in order to dig out holes for the concrete foundations, an ingenious method was resorted to, for at any time identifying the position occupied by the nail which had been removed. To effect this a right-angled triangle was framed in deal, at the two ends of which saw-cuts were made. Previous to the removal of the stake, the apex of the triangle was set to the nail indicating the situation of the centre of the column. Two other stakes were then driven beneath the saw-cuts, and two nails driven in at the ends of the saw-cuts. The wooden triangle being then removed, the centre stake was withdrawn, the hole made, and the concrete thrown in. The height of the surface of the mortar, varying with almost every column, was regulated by pegs driven to the correct level under the direction of Mr. Brounger. Another triangle of a somewhat similar character to, and having saw-cuts in the same position as, the one already described, having two of its angles adjusted to the two stakes remaining in the ground, determined the exact position in which the base-plates had to be fixed.

Castings examined and girders proved—how.

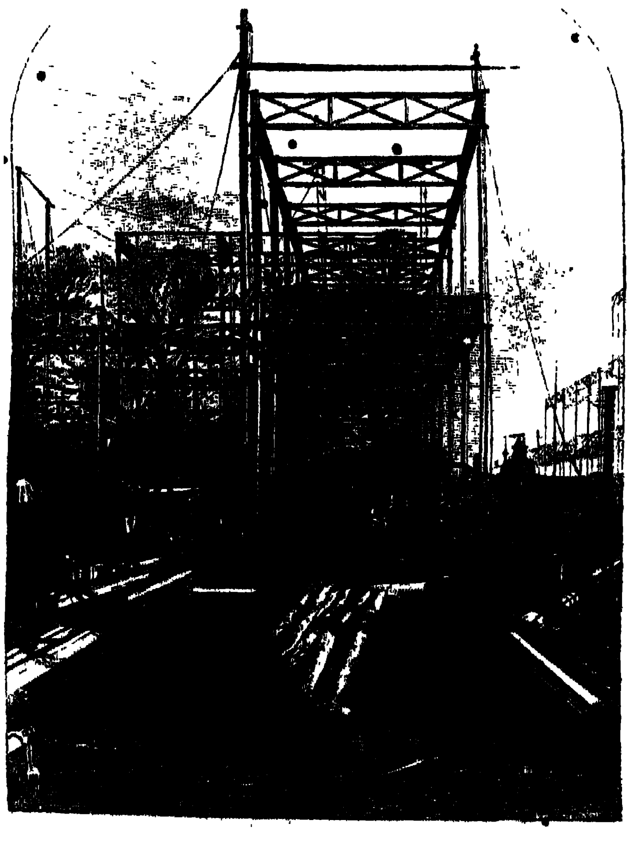
As every casting was delivered on the ground, it received a careful examination, and an immediate coat of paint. The girders, upon the perfect soundness of which the stability of the galleries and roof mainly depended, were subjected to a rigorous test, in a machine arranged for the purpose by Mr. Charles Heard Wild. One of Mr. Henderson's patent cranes was so placed, that, on a waggon containing girders being brought beneath its range, a girder was lifted from the waggon, and deposited upon a weighing apparatus. An account having been taken of its weight, the girder was again lifted by the crane, and carried forward to an extremely strong frame, the two ends of which corresponded in form and dimensions to the connecting pieces with their projections. The girder being securely confined in these clutches, a force was exerted upon it at the two points upon which the weight of the floors and roofing would have to be carried, that is to say, immediately over its vertical lines. The force thus communicated was applied by two pistons, forced upwards by a modification of **Bramah's** hydraulic press; the principle of which, it will be remembered, depends upon the power gained by forcing water (by means of a small piston) into a strong cylinder in which a larger piston works; the power being increased in the proportion borne by the area of the piston to be raised to the area of the small piston. A registering apparatus affixed to the pipe leading from the force-pump to the testing-machine, afforded the means of adjusting the pressure exercised by the hydraulic press. A careful observation of this apparatus conveyed the assurance, that every girder, according to its ultimate destination, was proved to a strain of either 9, 15, or 22 tons. After testing, the girder was released from its confinement, again raised by the crane, and stacked in a convenient place ready for removal. So admirably were the various arrangements made for conducting these operations, that it was possible for a girder to be lifted from its waggon, weighed, secured in the testing-machine, proved, released, again raised, and finally deposited, in less than four minutes.

The columns and girders, how raised,

In order to elevate the columns to their places, what is known in technical language as a pair of shear-legs was employed. This simple apparatus consists of two poles lashed together at their heads, and maintained in a steady position by ropes extending, from the apex of the triangle formed by the base-line of the ground, and the inclination of the poles, to one another, to stakes driven into the ground at a considerable distance. From the apex of the triangle a series of ropes passing over pulleys were suspended perpendicularly; and, by means of this "fall," the majority of the columns, girders, and other heavy portions of the construction, were elevated to their places. The operation of raising girders is shown in the view, fig. 18, but on so small a scale as to convey only an imperfect idea of its detail. Modifications of the simple apparatus described sufficed to hoist almost every part of the necessary iron-work. A connecting-piece was attached to each column previous to its elevation; and so soon as two columns with their connecting-pieces were fixed, a girder was run up, slipped between the projections of the connecting-pieces, and secured in its place. An opposite pair of columns having been similarly elevated, another girder was attached to them; and thus two sides of a square were formed, and maintained in a vertical posi-

steadied,

Fig. 18.



and fixed.

tion by poles acting as supports to them. Two other girders being then hoisted, and slipped between the connecting-pieces on the remaining two sides of the square, a perfect table was constructed. The "shores" or supports were then removed, together with the shear-legs, and the whole apparatus was at liberty, for the purpose of recommencing a similar operation in an adjoining 24-feet bay.

The second and third stories commenced without scaffolding—how.

When a sufficient number of these bays had been completed, starting from the intersection of the nave and transept, to warrant the addition, the hoisting of the columns for the first floor was commenced; more lofty shear-legs being of course employed. The extension of the ground-floor structure proceeding, as that of the first floor was carried on, a base was in turn afforded for the columns of the third tier; and thus the iron frame work of the whole building rose from the ground, firm and secure, without involving the necessity of any scaffolding whatever.

The preparation of the other work

While these operations of actual structure were being carried on, under the immediate superintendence of Mr. JOHN COCHRANE, the work of preparation was yet more vigorously pushed. The manufacture of the Paxton gutters, and the application of machinery to their formation, is so interesting, as to warrant a somewhat lengthened notice.

The gutter-making machine

In the year 1837, when Mr. PAXTON commenced the construction of the Chatsworth conservatory, in which similar gutters were employed, machinery had not been brought to bear upon their construction. By the use of a contrivance, the details of which were arranged by Mr. COWPER, a gentleman in the employment of Messrs. FOX and HENDERSON, a total length of upwards of 2,000 feet per day has been turned out, for many successive days. The pieces of timber destined to form the gutters are sawn into lengths of 24 feet, 6 inches deep, and 5 inches thick. Three of these pieces are fixed on the frame of a planing-machine, and by it are worked true and square. In figures 19, 20, 21, and 22 are given representations of the details of the gutter-making machine, erected at Messrs. FOX and HENDERSON'S workshops, near the Thames, at Chelsea. Fig. 19 is a side view of a block of cast-iron, to which steel cutters (AAAA) are attached by bolts and nuts (BBBB). Four blocks, of similar construction, are fixed to four spindles, and by the action of drums on the same spindles, set in motion by bands moved by a steam-engine of 20-horse power, the blocks are made to revolve with extreme rapidity. Any piece of timber exposed to the action of these cutters, must obviously be scooped out into the form of the outline of the cutters attached to each block. By modifying the form of the cutters almost any variety of section can be given to the timbers brought into contact with them. In the present case, the four sections A, B, C, and D (fig. 21), represent the successive action of the four sets of cutters lettered to correspond with them (on fig. 20), by means of which the larger cavity for the rain water, and the two smaller channels for the condensed water, are formed. The part removed by each set of cutters is shown by the hatched lines.

Fig. 19.

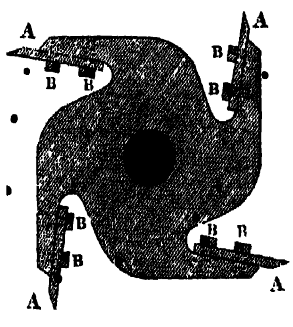


Fig. 22 represents a plan of the machine, looking down from above upon the gutters, the gutter being removed in order to show the action of the cutters more clearly.

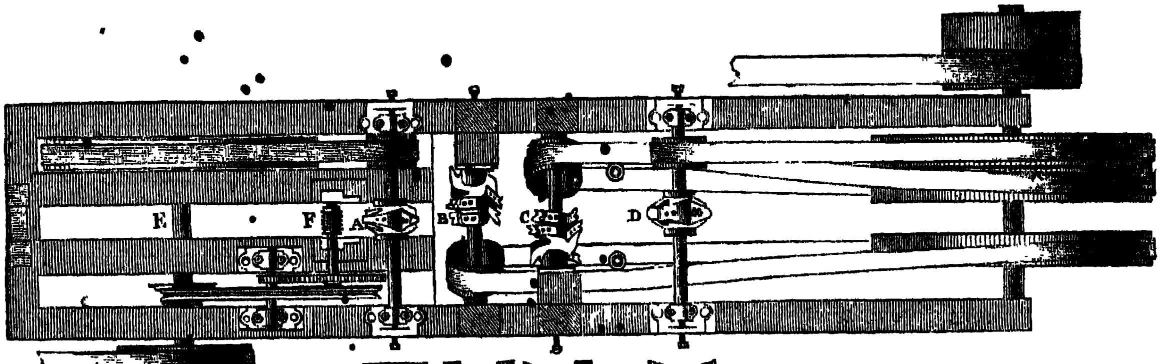
Its mode of operation

The operation may be explained as follows:—The piece of timber, properly squared, is placed upon the roller marked E, it is then pushed on until it comes in contact with the roller marked F, the projecting points on which so far seize it as to propel it forward to meet the rapidly revolving set of cutters marked A. Passing onwards to B, it is subjected to a second action. By C a third operation is performed, and in passing through D, a perfect form is given to the piece of timber. Thus, while, the end beyond D presents the perfect section of a finished gutter, the other end, which has not yet passed the set of cutters at A, remains in its original square form. In fig. 22, a vertical section is given, exhibiting the precise angle at which the cast-iron blocks are made to revolve, and the cutters to clear away the timber before them. O shows the section of the gutter acted on by the cutters, N the holdfast by which the gutter is kept in its place during the operation. By the use of this machine three feet of gutter can be made per minute, and, working night and day at this rate, the whole quantity required was completed in two months.

Fig. 20.



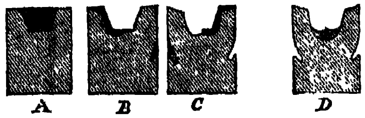


Fig. 21.

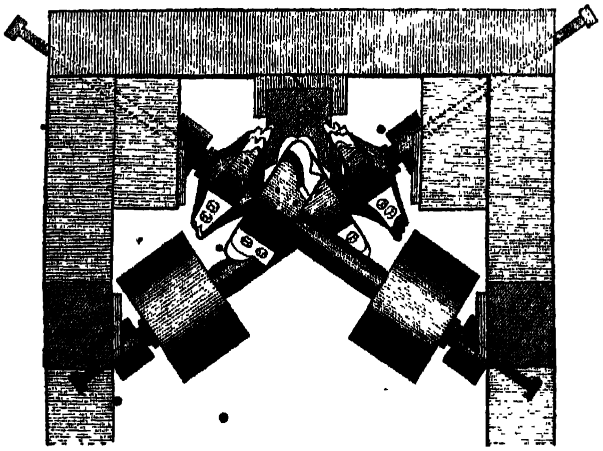
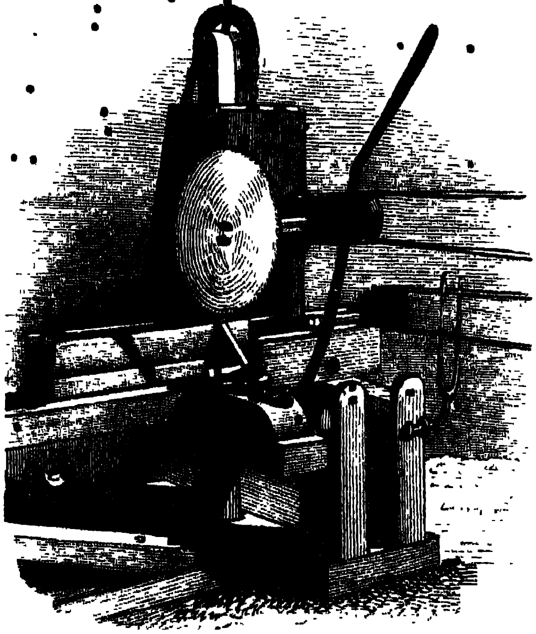
Fig. 22.



The Paxton gutters—how completed for use on the ground.

The Paxton gutters, thus prepared, were delivered on the ground, and after having been carefully examined, and the defective ones removed, they were conveyed to other machines (*vide* fig. 23), fixed upon the ground, by means of which they were finished ready for use. A large circular saw, the spindle of which could be raised or depressed by the action of a lever, had fixed in the centre of one of its sides two gouges, adapted to produce, by rapid revolution, a semicircular groove. A frame, the exact length of the gutters, was fixed at right angles to the plane of this saw. In the centre of this frame a species of chair was constructed, capable of turning round, and a shoe was fixed at the extremity of the frame farthest from the saw. The end of a gutter about 24 feet long was thrust into this shoe, and its middle supported by the chair already mentioned. The end nearest to the saw was then pressed down, and secured by an iron strap. Thus retained in position, it was necessarily bent to precisely that camber arranged to be ultimately given to it by suspension-rods and struts. The circular saw, revolving rapidly, was then made to descend until its edge came in contact with the end of the gutter, which it cut to the precise length required, and at exactly the right angle. The axis of the circular saw was then still further lowered down, until the gouges fixed on its side cut their way through the gutter, making a semicircular groove through its depth. One end being thus scooped out, the gutter was released from its position, turned round, and secured in a contrary direction in the shoe at the opposite extremity of the supporting frame. The other end of the gutter, thus presented in its turn to the saw, was then subjected to a similar process, after which it was removed, perfectly ready for the attachment of its iron bowstring.

Fig. 23.



The ridges.

A machine of somewhat similar construction (though much simpler) to that by which the Paxton gutters were made, brought the ridges to their proper form.

The sash-bars, Mr. Paxton's improvements in the manufacture of, generally.

In the course of numerous experiments which Mr. PAXTON had commenced as early as the year 1828, the great necessity for providing some machine by which a quantity of sash-bars might be speedily and economically cut, was forcibly impressed upon his mind. In the paper we have already quoted, Mr. PAXTON thus describes the origin of machines of this description:—"In 1837 the foundations "of the great conservatory (at Chatsworth) were commenced; and in constructing "so great a building, it was found desirable to contrive some means for abridging "the great amount of manual labour that would be required in making the "immense number of sash-bars requisite for the purpose. Accordingly, I visited "all the great workshops of London, Manchester, and Birmingham, to see if any"thing had been invented that would afford the facilities I required. The only "apparatus met with was a grooving-machine, which I had at once connected with "a steam-engine at Chatsworth, and which was subsequently so improved as to "make the sash-bar complete. For this apparatus the Society of Arts, in April, "1841, awarded me a medal, and this machine is the type from which all the "sash-bar machines found in use throughout the country to the present time are "taken. As the conservatory was erected under my own immediate superin"tendence, I am able to speak accurately as to the advantages of the machine. "It has, in regard to that building alone, saved in expenses 1,400*l*. The length of "each of the bars of the conservatory is 48 inches, only one inch shorter than those 'of the Exhibition Building. The machine was first used in its present form in 'August 1838, and its original cost, including table, wheels, and everything com'plete, was 20*l.* The motive power is from a steam-engine employed on the 'premises for other purposes, and any well-seasoned timber may be used. The 'attendants required are only a man and a boy, and the expense of the power required for it when in use is comparatively trifling. The sash-bars may be made of any form, by changing the character of the saws. There is one particular feature in working the machine, namely, that the bars are presented to the saws below the centre of motion, instead of above it, as is usual; and to the sides of the saw which are *ascending* from the table, instead of those which are *descending*. These arrangements were necessary to suit the arrangement of the 'teeth to the grain of the wood; for when the bars were presented to the saws 'in the usual way, the wood was crushed, instead of being cut and cleaned. It is 'essential that the machine should revolve 1,200 times in a minute to finish the 'work in a proper manner."

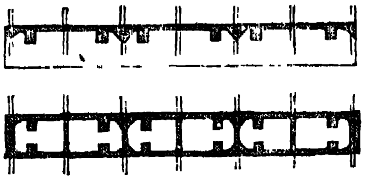

Fig. 25.

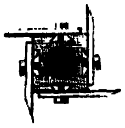

Fig. 28.

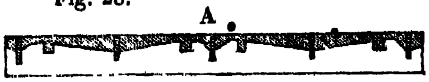

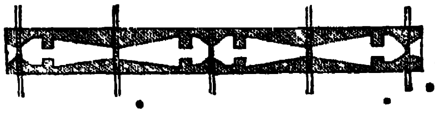

Fig. 24.

bar machine for the ling.

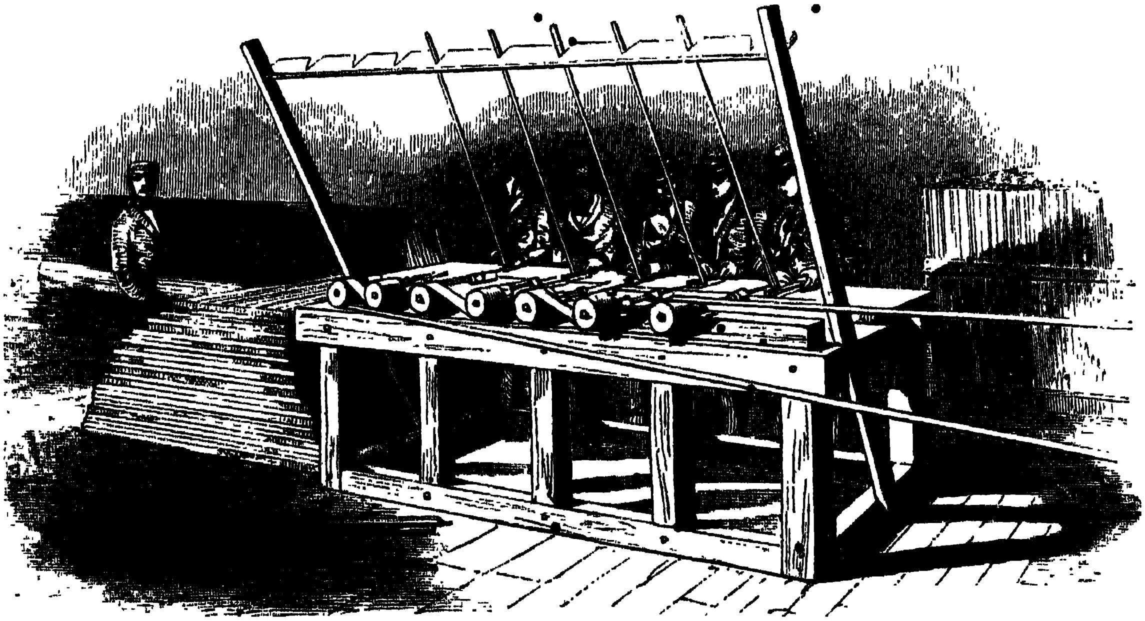
We shall now proceed to describe the modification of this machine, which is due to the inventive powers of Mr. BIRCH, of the Phœnix saw mills, near Cumberland-market, Regent's Park, with whom a contract was entered into by Messrs. FOX and HENDERSON for the supply of all the sash-bars for the roof, the upright bars for the vertical lights, and the ridges. Two of the principal points of difference between Mr. BIRCH's machine and that described by Mr. PAXTON are, that revolving cutters are substituted for saws, thus obviating difficulties incident to the grain of the wood; and that, by the addition of a second set of cutters, a plank passed between them is operated upon on its upper and under surfaces at the same time. In fig. 25 is shown a cast-iron block (somewhat similar to those previously described in connection with the gutter-cutting machine), to which are attached a variety of cutters. The rapid revolutions of the spindle (A fig. 26) operate upon the planks submitted to the action of the cutters, in the manner shown in fig. 28. So soon as the plank, presented by the feed-roller, has been operated upon by the rapid revolution of these miniature adzes, it is carried on by the roller C, and is subjected to the action of circular saws of varying diameters, the lesser of which cut just sufficiently deep to form the groove for the glass, while the larger pass completely through the plank, and divide it into four finished sash-bars. In figs. 24 and 28 is represented the mode in which the sash-bars for the vertical lights are made, the hatched lines indicating the parts removed; and in fig. 27, the way is shown in which the sash-bars for the roof have been cut. Modifications in the cutters affixed to the spindle A, fig. 26, produce the variation in form.

The sash-bars—how finished on the ground.

As delivered at the building, the sash-bars were cut approximately only to their length, and in order that it might not be necessary to execute any carpentering operation on the roof, it was requisite that they should be adjusted on the ground, ready for fixing. An arrangement of circular saws, set at the angles requisite to cut the ends of the sash-bars to accord with the pitch at which they would have to be presented for attachment to the ridges, served at once to cut a large number passed between them to a perfectly uniform length, and to form the necessary rebate for notching down upon the gutter edges.

To ensure the gimlet-holes necessary for nailing down the sash-bars being made with perfect regularity, a row of five gouges were set in motion by a band from an adjacent steam-engine, passing over a series of drums. The sash-bars, placed at a proper angle to them, were moved along by boys, in the manner shown in fig. 29, and presented to the points of the gouges, by the rapid revolution of which the necessary nail-holes were pierced.

Fig. 29.



The machine for painting the sash-bars.

It yet remained to paint these sash-bars, and even for that purpose the ingenuity of Messrs. Fox and Henderson provided mechanical assistance. A number of brushes were arranged in a frame, at right angles to one another, in such a manner that their bristles would just admit of the passage between them of a sash-bar. In a trough filled with colour a number of sash-bars were immersed, and one of them being lifted from it, loaded with colour, and presented to an aperture at one end of the series of brushes, it was passed through them to a corresponding aperture at the other end; by which process the whole of the superfluous paint was removed, and the sash-bar drawn out as neatly painted as it could have been by the workman's hand. This machine is represented in use in fig. 30.

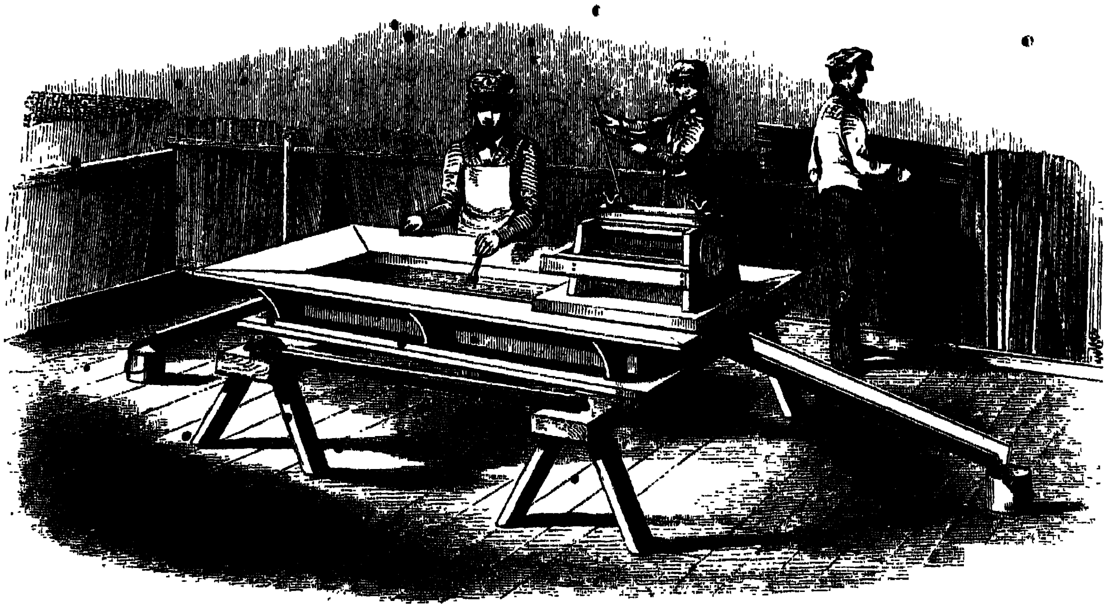
Morticing machine employed.

To facilitate the putting together of the sash-frames and sash-bars, considerable use was made of a machine for making mortices and tenons, patented by Messrs. FURNESS & Co., of Liverpool.

The making of the glass.

While these various machines were busily operating in the preparation of the necessary framework to receive the glass, Messrs. CHANCE BROTHERS & Co., of Smethwick, near Birmingham, to whom the contract for its supply had been committed, were not less actively employed. The large size of the sheets required (4 feet 1 inch by 10 inches), and the extraordinarily short time within which the immense quantity necessary had to be supplied, demanded the employment of numerous additional hands, and workmen had to be sought for from abroad to assist in the completion of the order within the requisite time. The mode of manufacturing the description of glass employed is a great improvement on the old system of crown-glass making; as by it the variation of the substance occasioned by the thickness of the glass, as it approaches the bull's-eye, is completely avoided. In the manufacture of sheet glass, the workman, having taken up a lump of glass on the end of his pipe, alternately blows, swings his ball of glass to and fro, and rolls it upon a metal table until it assumes the form of a long cylinder; the ends being then taken off, and the cylinder cut in the direction of its length, the sheet of glass falls down, is flattened to a perfectly true face, and is then trimmed off and finished.

Fig. 30.



Progress made in framing roof trusses;

During the preparation of the materials necessary to commence the construction of the Paxton roofing, active progress had been made in the framing of the wrought-iron trusses requisite to span the central 72-feet nave, and the 48-feet avenues on each side of it. A steam-engine of 6-horse power gave motion to drilling, punching, and cutting machines, represented in figs. 31 and 32. By means of these, the necessary pieces of bar-iron were adjusted to their requisite lengths. The holes for rivetting having been marked upon them with templates, were punched out, and any larger perforations necessary for extra-sized rivets, drilled. The various parts, thus prepared for combination, were then arranged upon platforms, and the holes in the various portions being made to correspond,

by means of drilling, punching, and cutting, machines;

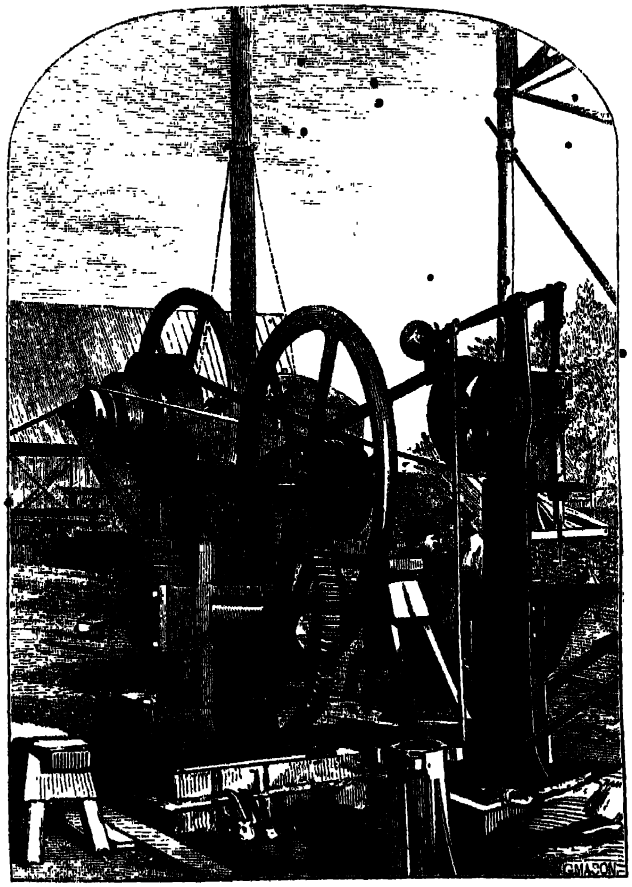
By rivetting up.

the operation of rivetting was gone through. A row of temporary forges was constructed by the side of the platforms, and the red-hot rivets taken from them were passed through the holes, and hammered by the workmen into their requisite forms.

The rate of delivery of columns, &c.

While these active preparations for the construction of the roofing were in progress, the daily supplies of castings of every description were of the most abundant nature; no less than 316 girders having been cast and supplied in one week. As fast as the columns came upon the ground, they were taken to their places and immediately fixed. Up to the 20th of September 77 columns had been supplied. By the week ending the 25th of October, the average number fixed per week amounted to nearly 200, and that rate of supply was continued for several subsequent weeks.

Figs. 31 and 32.



The formation of the transept ribs.

The attention of the contractors was next directed to the formation of the transept ribs. The choicest timber was selected for that purpose, and under the careful superintendance of Mr. **Fowler**, their form was set out upon a platform erected for the purpose, and the timbers for the first rib laid down. When the rib thus commenced was completed, it was made to serve as a template for the construction of a second; and thus one was fitted upon the others, until the pile had accumulated to four. Three of these having been then laid down in other places, the remainder were constructed upon them in a similar manner.

The progress of carpenters' and joiners' work generally.

As the preparations for putting together the main structure advanced, it was requisite to form the necessary wooden columns, sashes, matched and beaded boarding, louvre frames, &c., for the external enclosures. The vertical sashbars, cut at the *Phœnix* saw-mills, were delivered by Mr. BIRCH in large quantities. Sash-frames, also cut at the same mills, were supplied, and these were fitted together by the contractor's carpenters, whose time and labour in forming mortices and tenons was much economised by the employment of the machine before alluded to, patented by Messrs. FURNESS & Co.

The increasing intensity of the work evidenced by—

As supplies of the smaller castings necessary to complete the various portions of the structure poured in, the work of erection and putting together proceeded with wonderful rapidity. The progressive increase in the number of hands employed affords a tolerable indication of the increasing intensity of the work:—

The number of hands employed.

1850.	In the week ending	Sept. 6,	39	men were employed.
	,,	Oct. 4,	419	,,
	,,	Nov. 1,	1,476	,,
	,,	Dec. 6,	2,260	,,
1851.	,,	Jan. 3,	2,112	,,

and from that time, until within a month of the opening of the Exhibition, the average number has rarely fallen below 2,000.

Raising of the 72 and 48-feet trusses;

The task of raising to their places the 48 and 72-feet trusses, was accomplished with great facility in the following manner:—A single mast was maintained in a vertical position by ropes, similar to those described as steadying the shear-legs used for hoisting the girders. From the summit of this mast descended other ropes, with blocks and pulleys, for the purpose of gaining power in lifting. What is called a leading or guide-block, having been attached to the bottom of the mast, a rope passing through it was connected with a yoke drawn by a horse. The mast having been placed close alongside the line in which the roof-trusses had to be fixed, and one end of a rope secured to the truss, the draught of the horse caused the truss to ascend to the necessary height, being steadied in its ascent by other ropes secured to its two ends.

Facilities for the above.

When the truss thus hoisted was fixed in its resting place, the mast was moved along a plank by means of crow-bars, being maintained in a perpendicular position by the alternate slackening and tightening of the cords extending from its head to stakes driven into the ground. Having thus been moved 24 feet, it was ready for the operation of a second hoisting. Two of these great masts, fixed on each side of the transept, were used daily, and in one day as many as seven of the great 72-feet trusses have been raised to their proper position and secured, the apparatus for elevating them having travelled in a vertical position no less than 168 feet.

The beginning of December the time of the climax of activity.

Towards the beginning of December the climax of activity was arrived at, and the most trying operation in the whole construction of the building commenced, namely, the hoisting of the main ribs for the great transept roof. The easiest and at the same time the most secure method of proceeding, with respect to the conduct of this operation, had for some time occupied the attention of the contractors. An ingenious suggestion, made to them by Mr. WILBEE, one of their foremen, was at once adopted, and, with certain modifications, it was promptly carried out.

Framing together of the transept ribs preparatory to raising.

The floor for the lead flat was already completed, so that an admirable stage was prepared upon which to make the necessary arrangements. The ends of the column into which it was designed to drop the ends of the ribs, rose about four feet above the level of the lead flat, and on the tops of those columns timbers were laid, forming landing stages or tram-ways, to receive the ribs when hoisted. It was of course necessary to raise the ribs sufficiently high above the lead flat to enable their ends to descend upon the tram-ways. To effect this it was determined that two ribs should be placed on end, at a distance of 24 feet from each other, and framed together with purlins and diagonal ties, exactly as they would have to be framed in their finished state. Two complete sets of additional temporary ties were further introduced, to provide for the strain to which the ribs would necessarily be exposed from their altered position in the act of hoisting. The feet of the ribs were securely attached to stout pieces of timber, to afford the means of safely attaching the cords by which they were to be raised. Thus framed together, the ribs were moved on rollers to the centre of the square formed by the intersection of the nave and transept.

Provisions for raising.

On the extra strong trusses which have been described as spanning the nave at this point, two pairs of shear-legs were fixed at 24 feet from one another, and secured by ropes connecting them with distant portions of the building. These hoisting shears consisted of two legs on each side of the transept, each leg being formed of three stout scaffold poles lashed together at the top, and footed on planks laid across the lead flat. The heads of these shear-legs inclining slightly forwards, had connected with them blocks and pulleys from which descended ropes, attached to the four ends of the two ribs. The hoisting ropes connected with the sets of pulleys passed down from the shears to leading blocks, attached to the four columns at the angles of the intersection of the nave and transept. From these guide blocks they were led off diagonally to four powerful crabs, so arranged that the gangs of men employed at each were placed opposite the end of the rib acted upon by the crab they worked; and thus the foreman of each gang was enabled so to regulate the exertions of his men as to make them correspond with those of the remaining gangs, and to maintain the two ends on each side in a perfectly horizontal plane.

Raising.

As the diameter of the semicircular ribs exceeded the width of the transept by their own thickness, it became necessary, in order that they might pass between the trusses, to commence by raising two of their ends to a considerable height from the ground; and to maintain their diameter at the same angle of inclination until they were hoisted above the columns into which they had to drop. On raising them to a height of about 65 feet from the ground, the highest ends were drawn in a horizontal direction, so as to hang over a portion of the lead flats, and thus room was left to allow the other ends to be lifted to a corresponding height on the opposite side. The ribs were shifted slightly in a horizontal direction until the ends came over the columns, they were then lowered down upon rollers placed upon the tram-ways above mentioned, and by means of these rollers the ribs were moved along to the furthest end of the transept. The place in the centre of the building occupied by the ribs thus hoisted was immediately taken by another pair, which were similarly connected, raised, and moved to within 24 feet of the first pair.

When raised, how fitted together.

When the whole of the ribs were thus elevated to their places, the spaces between them were filled up with the necessary intermediate ribs and connections; and thus the whole roof was framed together complete.

Time occupied in raising.

The raising of the main ribs commenced on the 4th of December, and the whole sixteen were fixed in one week. It occupied about an hour to raise a pair of ribs from the ground to the level of the lead flat, but the previous preparations involved a much longer space of time. Eleven men worked at each crab, and about 16 were employed on the lead flat, to guide the ribs in their ascent, and see to the safe condition of the shear-legs and tackle. Considering the anxious nature of this performance, it must be regarded as a most gratifying circumstance, that the whole operation was accomplished without any untoward occurrence.

and number of men required.

Glazing the transept roof.

No sooner had the skeleton of the transept-roof been completed, than the work of glazing commenced. For a considerable portion of the height of the curve, ladders and temporary scaffolds enabled the workmen to proceed with their labours; but in order to complete the upper part an ingenious box was constructed, moving on wheels in the line of the gutters. This box was lowered down from the lead-flat at the summit to any portion of the roof.

Glazing the nave roof.

The glazing of the nave roof presented formidable difficulties, from the great extent of work to be got through in so short a space of time. The ingenuity of the contractors was, however, brought to bear upon the subject, and provisions were made by them for the simultaneous glazing of large areas, entirely independent of variations of weather. 76 machines were constructed, each capable of accommodating two glaziers; these machines consisted of a stage of deal about 8 feet square, with an opening in its centre sufficiently large to admit of boxes of glass, and supplies of sash-bars, putty, &c., being hoisted through it. The stage rested on four small wheels, travelling in the Paxton gutters, and spanned a width consisting of one ridge and two sloping sides. In bad weather the workmen were covered by an awning of canvas, stretched over hoops for their protection.

Construction of glazing-machines;

How used.

In working, the men sat at the end of the platform next to whatever work had been last done; from which they pushed the stage backward sufficiently far to allow them to insert a pane of glass, and as soon as that was completed they moved again far enough to allow of the insertion of another. In this manner each stage travelled uninterruptedly from the transept to the east and west ends of the building. The dexterity acquired by the men in working the machines was very remarkable. By means of them 80 men in one week put in upwards of 18,000 panes of glass, being not less than 62,600 feet superficial. The greatest number of panes inserted by a man in one day was 108, being 367 feet 6 inches of glazing. A somewhat similar machine has been constructed for the purpose of effecting any repairs that may be necessary in the finished roof, with the difference that its wheels travel upon the ridges instead of in the gutters, and that of course there is no aperture for the purpose of hoisting.

Quantity of work done.

Rapid supply of small castings.

Taking into account the innumerable quantity of small castings requisite, and the extreme rapidity with which they had to be supplied, their quality and cleanness is truly remarkable; and the fact of their having all issued from one foundry, that of the contractors at Smethwick, proves the great facility with which work of that nature can be executed in England.

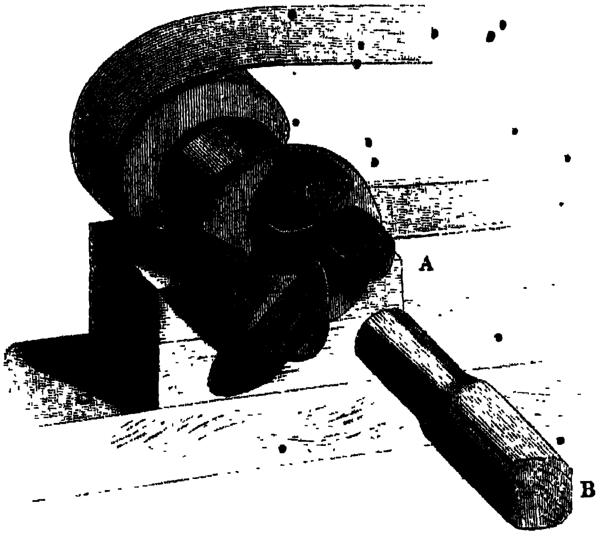
Celerity with which the painting of the nave roof was executed.

Among the later operations connected with the completion of the work, the most remarkable for the celerity with which it was conducted, was the ornamental painting of the nave roof. Iron straps, attached to the trusses, supported a number of scaffold poles, on which a perfect cloud of boards was laid, and as many as between 400 and 500 painters, by these means, worked their way, with extreme rapidity, from one end of the building to the other.

The application of machinery to make the gallery hand-rails.

The magnitude of this great building elevated into serious undertakings matters which, under ordinary circumstances, are accounted little more than trifles. Hence machinery was applied to the formation of the entire length of hand-rail required for the galleries. In fig. 33 is represented a set of cutters (A fig. 33), by exposure to the rapid revolution of which, roughly-shaped strips of mahogany were instantaneously converted into smooth and cleanly rounded hand-rails (B fig. 33). A little sand-paper and French-polish sufficed to bring them to their present excellent condition.

Fig. 33.



Paucity of accidents.

In summing up the description of any great engineering undertaking, it is too often a painful task to have to record the loss of life so frequently involved. Considering the difficulties of construction, the necessary perils to which the workmen were exposed, and their habitual imprudence, arising, partly, from real indifference to danger, and partly from bravado, it has been a source of congratulation that, in the performance of this contract, but very few accidents have occurred, and those, with two or three exceptions, of a slight nature.

Conclusion.

Having now brought to a close our description of the building as it exists, and of the processes by which its existence has been developed, it remains only to reiterate our conviction that the courage, energy, and strength represented by its construction should be regarded by every Englishman with emotions conducive to some yet higher manifestation of national capability; and at the same time to express a hope that the products of British industry (of which the building is but the shrine), may display, in a yet higher degree and in a yet more tangible and varied form, the sources of Commercial Power, so many indications of which it has been our happy privilege to trace in the edifice itself.

M. Digby Wyatt.

SCIENTIFIC REVISION AND PREPARATION OF THE CATALOGUE.

Peculiar circumstances of production of Catalogue.

THE circumstances under which this work is published appear to call for some observations upon the method of its production. From the fact that it is without a precedent in the annals of literature, it follows that its preparation and publication have been attended with peculiar, because unforeseen, difficulties. All those obstacles in the way of its completion which would necessarily develop themselves from the remarkable manner in which its contents have been created, and from the want of a guiding experience in the publication of works of this nature, have been contended with in its progress to a perfect state. The following may be considered as an outline of the manner in which the materials for the construction of this volume were collected, and of the system adopted to reduce them to a definite form, and as far as possible to a certain degree of consistency of expression and of harmony of proportion.

Exhibitors the authors.

It is not the least remarkable fact in connection with the Great Exhibition, that the Catalogue may be really regarded as the production of many thousands of authors,—represented by exhibitors themselves. By a decision of the Executive Committee, every exhibitor was required, prior to the reception of his articles at the Building, to have filled up a certain printed form, containing a description of his productions in the English language, accompanied with such general observations as might be suggested by the peculiar character of the things described and intended for exhibition. These forms, which were to be to the Catalogue what the MS. of an author is to his proposed work, were framed with care, and were accompanied with instructions for filling them up, which suggested those points on which interesting or important information might be supplied, together with the descriptive account. There were four varieties, each appropriated to one of the four great sections of Raw Materials, Machinery, Manufactures, and Fine Arts. The essential characters of these forms were similar in each section, but the instructions for filling them up differed necessarily with the peculiar differences suggested by each section. The subjoined form represents that used in sending in descriptions of machinery, and is a type of those used in the other sections:—

Catalogue form.

List of Articles of MACHINERY *to be exhibited by*

__________ Exhibitor's Surname. __________ Christian Name.

__________ Country. __________ Address, stating nearest Post Town.

__________ Capacity in which the Exhibitor appears, whether as *Producer, Importer, Manufacturer, Designer, Inventor,* or *Proprietor.*

No. of Articles. | DESCRIPTIONS.

Classification of the forms.

In order to facilitate their classification on being returned by exhibitors, the forms in the four different sections were printed in black, blue, red, and yellow, the latter applying to sculpture and fine art, the former to raw materials, and the intermediate ones respectively to machinery and manufactures. Every exhibitor was required to send in one of these forms, accompanied with a duplicate in every respect similar to it, and in so doing was supplied with a "receipt for catalogue forms," which was a guarantee for the reception of his goods into the Building. A very large number of these forms were printed and supplied to Local Committees, and to all exhibitors who applied for them. The instructions for filling them up were as follows:—

RULES FOR COMPILING THE CATALOGUE.

The Executive Committee are desirous of impressing upon Exhibitors that the formation of the Catalogue which, however great may be its bulk, must necessarily be compiled and printed in a very short time, will be much facilitated, if Exhibitors will have the kindness to follow the rules hereinafter prescribed when they furnish the descriptions of the Articles as they wish them to appear in the Catalogue.

Rules for compiling forms for Catalogues.

1. Every Exhibitor should write the description of every Article or series of Articles he exhibits, on paper of the same size as the present page (namely, about 13 inches by 8 inches). The paper must be written *on one side only*. There should be a margin of one inch at the left side of the page.

2. Should the description extend beyond a single page, each separate page must be marked with the Exhibitor's name, and numbered consecutively, both at the head and foot.

3. To prevent errors in compilation and misprinting, it is desirable the handwriting should be *very clear*, especial care being taken with all names and technical terms.

4. It is indispensable that each Exhibitor should furnish the following particulars, and in the exact order prescribed:—

I. . . . . Exhibitor's surname . . . . Christian name.
II. . . . . Country . . . . Address, stating the nearest Post Town.
III. . . . . Capacity in which the Exhibitor appears, whether as Producer, Importer, Manufacturer, Designer, Inventor, or Proprietor.
IV. The name and description of every Article of importance or class of Articles exhibited; each Article or Class beginning a separate paragraph, *e. g.*—

a Specimens of dyed Cottons, &c.
b Specimens of dyed Silks, &c.

5. It is necessary that the descriptions of the Articles should set forth, as far as may be practicable, the following particulars:—

Raw Materials and Machinery.

As respects Articles to be exhibited

In SECTION 1. RAW MATERIALS and PROCESSES, the descriptions should specify—

- *a* The commercial name in English, French, and German.
- *b* The scientific name.
- *c* The place where obtained; the name of the mines and period they have been worked, should be given with minerals.
- *d* The place where exported.
- *e* The uses.
- *f* The consumption.
- *g* The superior excellence of the particular Specimens.
- *h* In the case of processes, such as dyes, or prepared materials, such as mixed metals; it should be stated whether the Article is patented or not. The novelty and importance of the prepared product, and the superior skill and ingenuity manifested in the process of preparation should also be very briefly pointed out.
- *i* Where price is an element for consideration, the price at which the importer or producer can sell the Article.
- *j* Any particular features which the Exhibitor desires to be noticed by the Jury.

In SECTION 2. MACHINERY, the descriptions should specify—

- *a* The uses.
- *b* The novelty, if any, in the invention.
- *c* Superiority of execution.
- *d* Increased efficiency or economy.
- *e* The importance of the Article in a social or other point of view.
- *f* The place where produced.
- *g* Whether the Article is patented or not.
- *h* Where price is an element for consideration, the price at which the producer can sell the Article.
- *i* Any particular features which the Exhibitor desires to be noticed by the Jury.

Manufactures.

In SECTION 3. MANUFACTURES, the descriptions should specify—

- *a* The uses.
- *b* The novelty.
- *c* Superiority of execution.
- *d* Improved forms or arrangements.
- *e* Increased efficiency or economy.
- *f* New use of known Materials.
- *g* Use of new Materials.
- *h* New combinations of Materials.
- *i* Importance of the Article in a social or other point of view.

j The place or places where manufactured.
k Whether the Manufacture is patented; whether the design is registered.
l Where price is an element for consideration, the price at which the importer or manufacturer can sell the Article.
m Any particular features which the Exhibitor desires to be noticed by the Jury.

Fine Arts.

In SECTION 4. FINE ARTS, MODELS, SCULPTURE, and PLASTIC ART, the descriptions should specify—

a The name of the Artist or Designer, if the same should not be the Exhibitor.
b The uses.
c The novelty in design or treatment.
d Superiority of execution.
e New use of known Materials.
f Use of new materials.
g New combination of Materials.
h Improvements in processes of production.
i The place where the Article was made.
j If the Article is repeated in quantities for trade, the price at which it is sold by the Producer should be stated.
k Any particular features which the Exhibitor desires should be noticed by the Jury.

6. Exhibitors are required to make their descriptions brief, and to confine them as much as possible to facts.

7. Two COPIES, in the English Language, of the Exhibitor's descriptions, both being precisely alike, must be furnished before the Articles can be permitted to enter the Building. If an Exhibitor's Articles are sent in several packages, the list should indicate the contents of each separate package.

Illustrations.

8. Her Majesty's Commissioners have consented to allow Illustrations of Articles exhibited to be inserted in the large Catalogue, after approval by the Executive Committee. Exhibitors desirous to avail themselves of this privilege must communicate their intention of providing the Illustrations, and state their character, whether Engraving on Wood, on Steel, or Lithography. Communications are to be addressed to the Executive Committee, at the Building for the Exhibition, Hyde Park, London, marked on the outside, "CATALOGUE."

9. Exhibitors who may desire that their names and the descriptions of their productions should appear in any French and German Editions of the Catalogue which may be authorized, are requested to furnish at the same time with the two *English* Copies, a French and German translation of the descriptions, made out in all respects as before prescribed.

Attention paid to Rul

That a careful attention to these instructions would have developed a vast amount of most valuable and interesting knowledge, can scarcely be questioned; and that in a considerable proportion of cases such has been the result, will appear on examination of the contents of this volume. That such a degree of attention was not universal is only what was to have been expected, both in consequence of the pressure of time under which many exhibitors laboured, and also from the fact that a large proportion, occupied in exclusively industrial pursuits, were unused to literary composition. The forms, with their duplicates, on being filled up, were transmitted to the Executive Committee; the duplicate being retained by the Executive, the other copy was placed in the compilers' hands.

First stage of preparation for printing.

The first step in preparing these forms for the press was their arrangement into classes corresponding to the thirty divisions decided upon by the Executive. The number and variety of objects embraced by the returned forms rendered this a tedious and difficult task. On its being effected, the forms remained to be examined, and put into such a state as to satisfy the requirements of the printer. They were consequently read, and as far as possible thrown into that state of connection of parts, and removal of superfluous material, which might enable them to be set up in a convenient form in type.

Scientific revision and correction.

Although much had been by these means effected in the preparation of the material of the catalogues, the most important part of the labour involved, prior to its assuming its present form, remained to be accomplished. The scientific and technical inaccuracies of a large proportion of the returned forms, together with their literary reconstruction rendered in a large proportion of cases absolutely necessary, demanded attentive revision and correction. Several considerations rendered this extremely difficult. Among these were the shortness of the period absolutely allotted for the completion of the work, the impossibility of verifying the descriptions given with the objects of which they treated, and the immense variety of subjects comprehended by the Exhibition itself, and necessarily described in these forms in a manner in many instances more or less imperfect. The occasion called for a large amount of peculiar knowledge—of knowledge not to be gained by study, but taught by industrial experience, in addition to that higher knowledge, the teaching of natural and experimental philosophy. To meet these requirements the following plans were devised, and carried into operation. A number of scientific gentlemen gave their consent to undertake the revision and correction of proofs of the returned forms in their peculiar departments, with a view to remove from them those errors which might present themselves, and to supply what might appear requisite to give prominence to their really important features. In addition to this it appeared advisable, as critical observations were necessarily inadmissible, to relieve the tedium of mere description, and to assist in pointing out the leading features of interest in the objects described, or in direct relation with them, by appending, as the subjects of the proofs suggested, such brief annotations as might appear best calculated to effect these objects.

Plans adopted.

Suggestions as to principles of correction and annotation.

As a certain degree of harmony of procedure was considered absolutely necessary, in order to give a consistent character to such corrections and annotations, supplied as they would be from a variety of sources, a few suggestions of certain general principles were adopted, and as far as possible acted upon. It is not necessary to reproduce the whole of these suggestions in their original form; but since it is important that exhibitors should be informed of the principles which, to a great extent, guided and determined the corrections and annotations which are found in this work, they are here subjoined. Attention is particularly directed to suggestion 5, under the head annotations, by which it will be perceived that the character of critical notices has been strictly excluded from the annotations appended to the descriptions in this work.

Corrections.

1. *Corrections.* These will be chiefly of the following kind:—
    1. To correct in a general way any obvious typographical inaccuracies.
    2. To correct with care all technical and scientific errors in names, places, and things.
    3. Occasionally, if time permit, to recast badly composed sentences or expressions.
    4. To delete redundancies and self-laudatory terms, or expressions that could in any way be so construed, or critical and extraneous statements.

Annotations.

2. *Annotations.* Many of the proofs will undoubtedly suggest interesting elucidatory notes. As it is desirable that the same notes should not be repeated, the information which, under other circumstances, or in a volume of a different kind, it would be well to present in a mass, may be conveniently subdivided, and a portion appended to the most appropriate proofs on the subject to which it refers. Thus, for a vegetable or animal product, a line or two as to its history might be attached to one proof, a note upon the natural order or tribe yielding it to another, the uses to a third, the commercial importance, &c., to a fourth, &c. In the selection of proofs for annotation, those of course will be preferred which are in themselves the most interesting and suggestive. It is considered desirable that these notes should as far as possible partake of the following characters:—

Character of

1. To be as short, clear, and definite as possible.
2. To have reference, as far as may be, if the article cannot be seen—
    - *a.* To the article as described by the Exhibitor.
    - *b.* To its uses, history, consumption, production, &c. (See Memorandum for the instruction of Exhibitors in preparing the descriptions contained in forms for the Catalogue.)
3. To be of the following average length—
    - *a.* *Articles of primary importance,* as, for example, "cotton," "iron," "steam-engine," and such like, eight or ten lines.
    - *b.* *Articles of secondary importance,* four and three lines.
4. The same annotations not to be repeated or appended to more than one proof.
5. OBSERVATIONS OF A CRITICAL CHARACTER, IN EITHER SENSE OF THAT TERM, ARE INADMISSIBLE.

Difficulties attending transmission and return of proofs.

So soon as the work actually commenced, a mechanical difficulty of no common proportions presented itself. On the distribution of proofs for the purpose of annotation and correction, they were necessarily cut up into separate portions, which had destinations as far distant as Germany and remote parts of the United Kingdom, whither they were despatched for the purpose of ensuring their scientific and technical accuracy. Many thousand proofs were thus scattered in various directions, yet all were required to be gathered together again, and arranged precisely in the same form and order as that assumed prior to their dispersion. Some of these proofs were not more than three inches long, and not broader than a narrow ribbon, containing only two or three lines; the difficulty of determining and immediately affixing the proper place of such a minute strip in a work of such magnitude as the present, seemed to be great. A simple method of ascertaining not merely the place in the catalogue, but its entire history, its destination, annotator, and return was, however, contrived, and the history of every proof has thus been accurately recorded. The information thus obtained, was so accurate and precise, that on the temporary delay of very small proofs, their original destination was instantly discovered, together with the date of transmission, and the name of the annotator to whom they had been sent. Much punctuality characterized the return of the dismembered portions of this large volume. Had not such been the case, the original plan of scientific and technical revision could not have been persisted in. As a general rule, it was considered advisable to limit annotations to an average of eight or ten lines in length; but in certain instances, where peculiar technical, local, or scientific information has been available, this rule has been to a very considerable extent departed from.

Record of history of proofs.

Technological mistranslations.

The language of the arts among various nations has always been regarded as of extreme difficulty in translation. A considerable portion of this work is necessarily written in this language, and it is therefore to be expected that, notwithstanding the precautions employed, errors of description may occur in those parts of it which describe the productions of foreign exhibitors. It is requested that these may be pointed out. In a number of instances technical terms have been explained by notes. As far as it was possible foreign weights and measures have been converted into English.

Mottoes selected by Prince Albert.

The mottoes on the title-pages of this work were selected and placed by HIS ROYAL HIGHNESS PRINCE ALBERT.

There is a peculiar feature in this Catalogue to which attention requires to be directed. This is the fact, that it embodies to a large extent the science of commerce. An attempt has been made here to convert the changing and inaccurate conventional terms of trade into the precise and enduring expressions of science. In classes 1 to 4 of the Exhibition, are contained specimens of a vast proportion of the raw materials upon which human industry daily operates throughout the world. In the majority of the descriptions of the articles exhibited in these four classes, will be found the commercial names of the materials, together with their scientific equivalents. As an instance, may be mentioned the woods employed for furniture, which are enumerated, with their commercial names, their Latin names, their native habitats, and the uses to which they are applicable. In the present edition of this work, prepared as it has necessarily been under highly unfavourable circumstances as to accuracy and correction, this attempt may not be as successful as in future editions; but such arrangements are made in order to obtain this important and valuable result, as will render future editions of this Catalogue permanently valuable in this respect, not only to the naturalist, but also to commercial men. That this feature of the Catalogue will not be without

Catalogue valuable as illustrative of the science of trades.

its fruit in the promotion of the objects of industry, may be expected from the knowledge of the fact, that hitherto, in consequence of the absence of such information in a collected form, the greatest difficulties have been experienced by commercial men in their endeavours to introduce into trade any new material of industrial importance, or to obtain adequate supplies of materials already known, but known under a variety of changing, local and unintelligible terms. In the seventeenth century, ROBERT BOYLE perceived the important results likely to arise from the "naturalist's insight into trades." It may be hoped that such results will now not fail of their accomplishment.

Abridged Catalogue.

The smaller Catalogue is an abstract of the present work. It was prepared by condensing the revised and corrected slips forming the Illustrated Catalogue. For economy of space it was necessary to confine the descriptions in that work to an average length of three or four lines.

Size.

On the first announcement of a descriptive Catalogue, erroneous ideas as to its size prevailed, to so large an extent as to lead to the fear that a sufficiency of type of the kind required could scarcely be obtained within the necessary time. Statements appeared which gave birth to the opinion that such a work could not be contained in less than ten volumes of eight hundred pages each; and for a considerable time it appeared probable that more than three such volumes would be required to complete this record of universal industry. It was soon rendered apparent that the estimates thus formed were incorrect. The articles contributed by a number of exhibitors—as in textile manufactures—were of a kind which did not admit of descriptions at length; and the returned forms of such articles were generally received written in the customary abbreviated language of commerce. In cases of another kind, where descriptions at greater length were not only admissible, but desirable, economy of space has been obtained by the adoption of a condensed style. The Descriptive Catalogue has thus been reduced, notwithstanding the addition of annotations, to a convenient size.

Permanent Value.

That a work produced under the circumstances in which this Catalogue appears should contain inaccuracies, can less be cause of surprise than would its complete accuracy. One of the greatest obstacles to its correctness has been the incessant necessity for alterations of place and insertions of fresh material. In its preparation, however, an attempt has been made to communicate to it a value enduring beyond that of the occasion of its production. The vast and wonderful accumulation of the products of human industry, of which it professes to be the exponent, is gathered only for a time. The intention of this Great Collection accomplished, and its objects realized, the industrial store must be again scattered among the nations contributing to its gathering. But this record of the history of the Great Exhibition must endure beyond the duration of the Exhibition itself. May it remain to indicate to other times the successful accomplishment of the greatest conception of our own, and the favour of the Divine Providence effecting that result.

ROBERT ELLIS.

ANNOTATORS OF THE CATALOGUE.

Professor Owen, F.R.S.
Baron Justus Liebig, F.R.S.
Professor Lindley, F.R.S.
Professor Forbes Royle, F.R.S.
Professor Bell, F.R.S., Sec. R.S.
Professor E. Forbes, F.R.S.
Professor Ansted, F.R.S.
Professor Hosking.
Professor A. De Morgan, M.A.
Philip Pusey, M.P., F.R.S.
Rev. J. Barlow, F.R.S.
Rev. J. Booth, F.R.S.
Capt. L. L. Boscawen Ibbetson, F.R.S.
James Glaisher, F.R.S.
J. E. Gray, F.R.S.
Robert Hunt, Keeper of Mining Records.
Robert Ellis, F.L.S.
Samuel Clegg, Jun., F.G.S.
W. De La Rue, F.R.S.
J. Spurgin, M.D.
John Wilson, F.R.S.E.
Henry Dibdin.
W. C. Aitken.
H. Maudslay, C.E.
Robert Hendrie, Jun.
J. A. Nicholay.

Official Revision and Sanction for Publication by Lieut.-Colonel J. A. Lloyd, F.R.S.
Scientific Revision and Preparation by Robert Ellis, F.L.S.
Historical Introduction by Henry Cole.
Construction of the Building by M. Digby Wyatt, C.E., F.R.I.B.A.
Classification of Subjects in the Thirty Classes into which the Exhibition is divided by Dr. Lyon Playfair, F.R.S.
Compilation and Preparation of the Abridged Catalogue by G. W. Yapp.

Technical information and assistance have also been rendered by Mr. G. Taylor, Mr. T. Battam, Professor Wallace, M.A., Mr. C. Tomlinson, Mr. John Graham, Mr. E. H. Denison, and other Gentlemen. Much valuable information and assistance have also been kindly furnished by the Royal Commissioners for several of the Foreign States exhibiting. Their contributions have been inserted partly in the form of notes, and occasionally in that of a short introduction.

CLASSIFICATION OF SUBJECTS IN THE THIRTY CLASSES INTO WHICH THE EXHIBITION IS DIVIDED.

CLASS.

RAW MATERIALS.

I. Mining, Quarrying, Metallurgical Operations, and Mineral Products.
II. Chemical and Pharmaceutical Processes and Products generally.
III. Substances used for Food.
IV. Vegetable and Animal Substances, chiefly used in Manufactures, as Implements, or for Ornament.

MACHINERY.

V. Machines for direct use, including Carriages and Railway and Naval Mechanism.
VI. Manufacturing Machines and Tools.
VII. Civil Engineering, Architectural, and Building Contrivances.
VIII. Naval Architecture and Military Engineering; Ordnance, Armour, and Accoutrements.
IX. Agricultural and Horticultural Machines and Implements.
X. Philosophical Instruments and Processes depending upon their use; Musical, Horological, and Surgical Instruments.

MANUFACTURES.

XI. Cotton.
XII. Woollen and Worsted.
XIII. Silk and Velvet.
XIV. Manufactures from Flax and Hemp.
XV. Mixed Fabrics, including Shawls, but exclusive of Worsted Goods (Class XII.).
XVI. Leather, including Saddlery and Harness, Skins, Fur, Feathers, and Hair.
XVII. Paper and Stationery, Printing and Bookbinding.
XVIII. Woven, Spun, Felted, and laid Fabrics, when shown as specimens of Printing or Dyeing.
XIX. Tapestry, including Carpets and Floor-cloths, Lace and Embroidery, Fancy and Industrial Works.
XX. Articles of Clothing for immediate personal or domestic use.
XXI. Cutlery and Edge Tools.
XXII. Iron and General Hardware.
XXIII. Working in precious Metals, and in their imitation, Jewellery, and all articles of Virtu and Luxury, not included in all other Classes.
XXIV. Glass.
XXV. Ceramic Manufactures, China, Porcelain, Earthenware, &c.
XXVI. Decoration Furniture and Upholstery, including Paper-hangings, Papier Maché, and Japanned Goods.
XXVII. Manufactures in Mineral Substances, used for building or decoration, as in Marble, Slate, Porphyries, Cements, Artificial Stones, &c.
XXVIII. Manufactures from Animal and Vegetable Substances, not being Woven or Felted, or included in other Sections.
XXIX. Miscellaneous Manufactures and Small Wares.

FINE ARTS.

XXX. Sculpture, Models, and Plastic Art.

I. *Mining, Quarrying, Metallurgical Operations, and Mineral Products.*

A. MINING AND QUARRYING OPERATIONS.
1. Quarries and open workings.
2. Streaming; washing alluvial deposits.
3. Mines worked on the lode.
   a. Sinking of shafts.
   b. Cutting adits.
   c. Driving levels.
4. Mines worked on the bed.
   a. Sinking shafts.
   b. Driving levels.
   c. Cutting stalls or headings.
5. Salt deposits.
6. Ventilation; Safety Lamps, and other modes of Lighting.
7. Methods of raising Men, Ore, and Water.
   a. Raising Ore.
   b. Lowering and raising Miners.
   c. Draining.

B. GEOLOGICAL MAPS, PLANS, AND SECTIONS.

C. ORES AND METALLURGICAL OPERATIONS.
1. Ores and the Methods of dressing and rendering Ores merchantable.
   a. Ores of the more common Metals, as of Iron, Copper, Zinc, Tin, Lead.
   b. Native Metals, as Gold, Silver, Copper, &c.
   c. Ores used for various purposes, without reduction, as Peroxide of Manganese, &c.
2. Methods of roasting, smelting, or otherwise reducing Ores.
   a. The common Metals, as Iron, Copper, Zinc, Tin, Lead.
   b. The Metals more generally used in combination, as Antimony, Arsenic, Bismuth, Cadmium, Cobalt, Nickel, &c.
3. Methods of preparing for use the nobler Metals, as Gold, Silver, Mercury, Palladium, Platinum, &c.
4. Adaptation of Metals to special purposes.
   a. Metals in various Chemical states, as Iron in the

condition of Cast and Malleable Iron, Steel &c.
b. Metals in their progress to finished Manufactures, as Pigs and Ingots, Sheets, Bars, Wires, &c.
5. Alloys, and methods of rendering more generall useful Metals and their alloys—
a. Statuary, Bronze, Gun, Bell, and Speculum Metals.
b. Brass, and alloys used as a substitute for it.
c. White alloys, as Britannia Metal, German Silver, Pewter, &c.
d. Type, Sheathing Metals, and other alloys.

D. NON-METALLIC MINERAL PRODUCTS.
1. Minerals used as Fuel—
a. All kinds of Coal and derived products.
b. Lignite and Peat ,, ,,
c. Bituminous bodies and native Naphtha.
2. Massive Minerals used in construction.
a. For purposes of construction generally—
Siliceous or Calcareous Free Stones and Flags.
Granites, porphyritic and basaltic Rocks.
Slates.
b. For purposes of Ornament, Decoration, and th Fine Arts—
Marbles.
Alabaster, Spar, &c.
Serpentine and other hard rocks susceptible of high polish.
c. Cements and Artificial Stones—
Calcareous and Hydraulic Cements.
Puzzuolanas, Trass, &c.
Gypsum for plaster.
Artificial Stones.
3. Minerals used in the manufacture of Pottery and Glass—
Sands, Limestones, &c., for Glass-making.
Various Clays and felspathic Minerals, as those used for Bricks, Tiles, and various kinds of Pottery and Porcelain.
Siliceous, Calcareous, and other Minerals, used in Plastic Arts.
4. Minerals used for personal Ornaments, or for Mechanical and Scientific purposes.
a. Gems and Precious Stones.
b. Models of Minerals and Crystals, &c.
c. Collections of Minerals for scientific or educational use.
5. Minerals used in various Arts and Manufactures.
a. Simple bodies or compounds containing the Alkalis or Alkaline Earths—
Those used principally for culinary purposes or for Medicine, as Salt, Mineral Waters, &c.
Those used in various manufactures, as Sulphur, Borax, &c.
b. Earthy and semi-crystalline Minerals.
Minerals used for grinding and polishing, as Grindstones, Honestones, Emery, &c.
Lithographic Stones, Drawing Chalks, and Slate Pencils.
Graphite.
Earthy and other Minerals used as pigments, or for staining, dyeing, and colouring.
Various Minerals used in Manufactures; as Alum Schist, Fuller's Earth, French Chalk, Casting Sands, &c.
6. Soils and Mineral Manures.

II. *Chemical and Pharmaceutical Processes and Products generally.*

A. CHEMICAL SUBSTANCES USED IN MANUFACTURE.
1. From the Mineral Kingdom.
a. Non-metallic substances.
Those used principally in their elementary state, as Sulphur, Phosphorus, &c.
Acids, as Sulphuric, Muriatic, Nitric, Boracic, &c.
Miscellaneous Manufactures, as Sulphuret of Carbon, Chloride of Sulphur, &c.
b. Alkalies, Earths, and their compounds.
Alkalies and their Alkaline Salts, as Soda, Potash, Ammonia, and the Carbonates, &c.
Neutral Salts of the Alkalies, as Sulphate, Nitrate of Soda, Saltpetre, Borax, &c.
Earths and their compounds, as Lime, Magnesia, Barytes, Strontia, Alumina, &c.
c. The compounds of Metals proper, as Salts of Iron, Copper, Lead, &c.
d. Mixed Chemical Manufactures, as Prussiate of Potash, &c.
2. From the Organic Kingdom, and not included in Sections III. and IV.
3. Manufactured Pigments, Dyes, and miscellaneous Chemical Manufactures. (See also Section IV.)
a. Pigments employed in House Decoration, and for colouring Woods.
b. Pigments used for Textile Fabrics.
c. Pigments used for Paper Hangings, and for felted and laid Fabrics generally.
d. Artists' Colours.
e. Miscellaneous Chemical Manufactures.

B. RARER CHEMICAL SUBSTANCES, MANUFACTURED CHIEFLY FOR THE USE OF THE SCIENTIFIC CHEMIST.
1. From Substances of the Mineral Kingdom.
2. ,, Vegetable ,,
3. ,, Animal ,,

C. CHEMICAL SUBSTANCES USED IN MEDICINE AND IN PHARMACY.
1. From the Mineral Kingdom.
a. Non-metallic substances and their compounds.
b. Alkalies, Earths, and their compounds.
c. Metallic Preparations.
2. From the Vegetable Kingdom, when shown for Pharmaceutical purposes. (See also Sections III. and IV.)
a. Vegetable Infusions, Decoctions, and Solutions, clear or saccharine.
b. Tinctures.
c. Extracts and Inspissated Juices.
d. Resins, Gum Resins, and Oleo Resins and Balsams.
e. Aloes, &c.
f. Gums as Acacia, Tragacanth, &c.
g. Essential Oils, Cajeput, Savine, Turpentine, &c.
h. Fixed Oils, as Castor, Croton, Almond, Olive, &c.
i. Vegetable parts, as leaves of Digitalis, Hemlock, roots of Jalap, Ipecacuanha, &c.
j. Barks as imported, Cinchona, Cascarilla, Cusparia, &c.
k. Vegeto-Alkalies, their Salts and other Crystalline principles of medicinal substances.
l. Vegetable Acids.
m. Miscellaneous Compounds.
3. From the Animal Kingdom.
a. Codliver and other Animal Oils for internal or external application.
b. Unguents of Spermaceti, Lard, Oil, and combinations of them.
c. Antispasmodics, as Musk, Castoreum, Civet, Ambergris, &c.
d. Phosphorus, Ammonia, and their products.
e. Irritants, as Cantharides.
f. Antacids, as Crabs'-eyes, Calcareous concretions of the Craw-fish, Cuttle-bone, &c.

III. *Substances used as Food.*

VEGETABLE KINGDOM.

A. AGRICULTURAL PRODUCE—CEREALS, PULSES, OIL SEEDS, ETC.
1. Common European Cereals.
2. Cereals more rarely cultivated in Europe.
3. Millet and other small Grains used as food.
4. Pulses and Cattle Food.
5. Grasses, Fodder Plants, and Agricultural Roots.
6. The Flours or preparations of the above classes.
7. Oil Seeds and their Cakes.
8. Hops and other aromatic plants used for like purposes.

B. DRIED FRUIT AND SEEDS.
1. Raisins, Currants, Figs, Plums, Cherries, Apricots, &c.
2. Dates, Tamarinds, Dried Bananas, &c.
3. Almonds, Chesnuts, Walnuts, &c.
4. Cocoa-nuts, &c,

C. SUBSTANCES USED IN THE PREPARATION OF DRINKS.
1. Real Teas of all kinds.
2. Substitute for Teas, as Paraguay, Arabian, Bencoolin, &c.
3. Coffee of all kinds, and Cocoa Seeds and Nibs.
4. Various substances, as Chicory Roots, Amande de Terre, Guarana Bread, &c.

D. INTOXICATING DRUGS, FERMENTED LIQUORS, AND DISTILLED SPIRITS FROM UNUSUAL SOURCES.
1. Fermented Liquors and Spirits from unusual sources.
2. Tobacco.
3. Opium.
4. Hemp, and other Intoxicating Drugs.

E. SPICES AND CONDIMENTS.
1. Cinnamon, Cassia, and their substitutes.
2. Nutmegs and Mace; Cloves and Cassia Buds.
3. Peppers, Capsicum, Mustard, Vanilla, Pimento, Cardamums, &c.
4. Ginger, Turmeric, &c.

F. STARCH SERIES.
1. Starches of all kinds prepared from Wheat, Rice, Potatoes, Maize, &c.
2. Arrowroots of all kinds, Tous les Mois.
3. Sagos from the Palms, Cassava, Tapioca, &c.
4. Lichens of all kinds.
5. Other Starchy Substances, as Portland Sago from *Arum Maculatum*, and from various like plants.

G. SUGAR SERIES.
1. Sugars from the Cane and Beet.
,, Maple and Palms.
,, Birch, Poplar, Oak, and Ash.
Grape Sugar.
2. Liquorice, Sarcocoll, &c.

ANIMAL KINGDOM.

H. ANIMAL FOOD AND PREPARATIONS OF FOOD AS INDUSTRIAL PRODUCTS.
1. Specimens of preserved Meats.
2. Portable Soups, and concentrated nutriment as consolidated Milk, &c.
3. Caviare, Trepang, &c.
4. Articles of Eastern commerce, as Shark Fins, Nest of the Java Swallow, &c.
5. Honey and its preparations.
6. Blood and its preparations.
7. Industrial Products, as Glue, Gelatine, Isinglass, Gluten, &c.

IV. *Vegetable and Animal Substances, chiefly used in Manufactures, as Implements, or for Ornaments.*

VEGETABLE.

A. GUM AND RESIN SERIES.
1. Gums of all kinds of natural occurrence—
Gums made artificially, as British Gum.
Mucilaginous Seeds, Barks, Pods, and Seaweeds.
2. Resins—
Resins and Balsams of all kinds.
Gum Resins.
Gum Elastics and Gutta Percha.
Distilled Resins and Varnishes.

B. OIL SERIES.
1. Volatile Oils, including Camphor.
2. Drying Fat Oils.
3. Non-drying Fat Oils.
4. Solid Oils.
5. Wax.
6. Distilled Fat Oils.

C. ACIDS, AS ACETIC, CITRIC, TARTARIC, OXALIC, &c.

D. DYES AND COLOURS.
1. Indigos.
2. Madders.
3. Lichens and their preparations.
4. Dyeing Barks, as Acacias, Quercitron, Mangrove, &c.
5. Woods, as Logwood, Brazil wood, Peach wood, Fustics, &c.
6. Flowers and Berries, as Persian Berries, Safflower, Saffron.
7. Miscellaneous, as Turmeric, &c.

E. TANNING SUBSTANCES.
1. Pods, Berries, Seeds, and Fruits of various kinds, as *Algaroab*, *Acacia*, Nib-nib and Divi-divi Pods, &c.
2. Barks of various kinds, as Barks of the Babool, Brazilian Acacias, Murici, Bucida, Gordonia.
3. Galls, and similar Tanning Materials.
4. Catechu, Kino, Gambeer, &c.

F. FIBROUS SUBSTANCES, INCLUDING MATERIALS FOR CORDAGE AND CLOTHING.
1. Cottons of all kinds.
2. Hemp and Flax; Manilla Hemp and New Zealand Flax.
3. China Grass, Nettle Fibre, Plantain, and Pine Apple Fibre.
4. Sunn, Jute, and other tropical substitutes for Hemp Flax.
5. Coir, or Cocoa-Nut Fibre, Gomuti, &c.
6. Rushes and Miscellaneous Substances.

G. CELLULAR SUBSTANCES.
1. Corks of all kinds.
2. Woods and Roots used for Corks, as the *Ochroma lagopus* and *Anona palustris*
3. Rice-paper of China.
4. Birch Bark, Pottery Bark, Citrus Rind, &c.
5. Substances used as Amadou.

H. TIMBER AND FANCY WOODS USED FOR CONSTRUCTION AND ORNAMENT, AND PREPARED BY DYEING.
1. Suited chiefly for purposes of construction, or for the Navy.
2. Suited chiefly for Ornamental Work.
3. Prepared Woods, as by Kyan's, Payne's, Bethell's, and Boucherie's processes.

I. MISCELLANEOUS SUBSTANCES.
1. Substances used as Soap, as Quillai Bark, Soap Berries (*Sapindus saponaria*), Soap Roots (*Saponaria officinalis, &c.*).
2. Perfumes, as Pucha Pat, Vetiver, Spikenard, Tonka beans, &c.
3. Substances used mechanically, as Teazels, Dutch Rushes, &c.
4. Seeds and fruits used for Ornamental purposes, as Ganitrus Beads, the Ivory Nut, the Doom Palm, Coquilla Nuts, Bottle Gourds, &c.

ANIMAL.

J. FOR TEXTILE FABRICS AND CLOTHING.
1. Wool, Hair, Bristles, Whalebones.
2. Silk from the Silk-worm *Bombyx Mori*, and from other species in India, *e. g. Bombycilla Cynthia* and *Attacus Paphia.*
3. Feather, Down, Fur, Skins.
4. Miscellaneous.

K. FOR DOMESTIC OR ORNAMENTAL PURPOSES, OR FOR THE MANUFACTURE OF IMPLEMENTS.
1. Bone, Horn, Hoofs, Ivory, Tortoiseshell, Shagreen, Quills.
2. Pearls, Seed Pearl, Mother-of-pearl, Coral, and Shells generally.
3. Oils, Tallows, Spermaceti, Wax, Lard.
4. Miscellaneous, as Sponge, Goldbeater's-skin, Catgut, Silkworm-gut, Bladders, &c.

L. AS AGENTS IN THE MANUFACTURE OF VARIOUS ARTICLES.
1. Glue, Isinglass, Gelatine, Bone-black, Ivory-black, Animal Charcoal.

M. FOR THE PRODUCTION OF CHEMICAL SUBSTANCES.
Blood, Bones, Horns, &c., for the production of Phosphorus, the Prussiates, the Superphosphates, &c.

N. FOR PIGMENTS AND DYES.
1. Cochineal and Carmine.
2. Dyes from the Galls of the Aphides.
3. Gall-stone, pigment from Ox-gall.
4. Indian dyes from the Coccus, the various kinds of Lacs.
5. Miscellaneous, as Sepia, Enena d'Orient, &c.

MACHINERY.

V. *Machines for direct use, including Carriages and Railway and Naval Mechanism.*

A. STEAM ENGINES AND BOILERS, WATER AND WIND MILLS, AND VARIOUS OTHER PRIME MOVERS.
1. Boilers.
2. Land Engines.
3. Marine Engines.
4. Windmills.
5. Water-wheels and Tourbines.
6. Water-pressure Engines, as Richenback's and Armstrong's.
7. Vacuum Power Engines.
8. Electro-Magnetic Engines, &c.
9. Miscellaneous.

B. SEPARATE PARTS OF MACHINES, SPECIMENS OF WORKMANSHIP. (See also WATER and GAS WORKS in VII.)
1. As heavy Castings or Forgings in the rough; Castings or Forgings, plain, intricate, or beautiful, in the Rough.

- 2. Specimens of Turning in Metals.
- 3. Specimens in filing and finished Work in Metals, such as Surfaces, Irregular Figures, &c.
- 4. Valves, Cocks, Pistons, Governors, &c.

C. PNEUMATIC MACHINES.
- 1. Air Pumps.
- 2. Blowing Fans.
- 3. Blast Engines for Furnaces, &c.
- 4. Miscellaneous.

D. HYDRAULIC MACHINES, CRANES, ETC., PILE DRIVERS, ETC. (See also VII.)
- 1. Hydraulic Machines—
  - Pumps and Fire Engines.
  - Water Rams.
  - Hydraulic Presses, &c.
  - Water-meters, &c.
- 2. Cranes—
  - Any sort of Crane motion and contrivances, Jacks of all sorts. (For Windlasses, Capstans, and Blocks, see VIII. E.)
- 3. Piling Engines.—(See also VII. A.)
  - By hand power, or steam.
  - Pile Sawing Machines.
  - Pile Extractors, &c.

E. LOCOMOTIVES AND RAILWAY CARRIAGES, &c.
- 1. Railway Locomotives.
- 2. Common Road Locomotives.
- 3. Railway Carriages, Trucks, and Waggons.
- 4. Railway Velocipedes, &c. &c., of all sorts.
- 5. Atmospheric Railway Apparatus.
- 6. Carriage Breaks.
- 7. Buffers, Couplings, &c.

F. RAILWAY MACHINERY AND PERMANENT WAY.
- 1. Permanent Way complete.
- 2. Sleepers.
- 3. Chairs, &c.
- 4. Rails.
- 5. Switches.
- 6. Turntables.
- 7. Station Arrangements.
- 8. Signals.
- 9. Miscellaneous.

G. WEIGHING, MEASURING, AND REGISTERING MACHINES FOR COMMERCIAL AND NOT FOR PHILOSOPHICAL PURPOSES.
- 1. Commercial Weighing Instruments.
- 2. Instruments of Measure.
- 3. Registering Instruments, Gauges, Indicators, and Telltales.

V. *a. Carriages generally—not including those connected with Rail or Tram Roads.*

A. FOR TOWN USE.

Dress Vis-à-Vis.
Dress Coach.
Dress Chariot.
Landau.
Landaulet.
Step-piece Landau.
Barouche.
Sociable.

B. TRAVELLING CARRIAGES.

Coach.
Driving Coach.
Chariot.
Britska Chariot.
Dormeuse Post Chariot.
Post Chariot.
Britska.
Droitska.
Fourgon.
Invalid Carriage.
Sledges, &c.

C. FOR GENERAL USE.

Basterna.
Brougham.
Double Brougham.
Clarence.
Pilentum.
Cariole.
Domestic.
Driving Phaeton.
Mail Phaeton.
Cabriolet Phaeton.
Park Phaeton.
Pony Phaeton
Curricle.
Cabriolet.
Headed Chaise.
Tilbury.
Stanhope.
Dennett.
Gig.
Irish Car.
Dog Cart.
Pony Chaise.
Invalid Bath Chair.
Velocipedes.

D. PUBLIC CARRIAGES.

Mail Coach.
Stage Coach.
Omnibus.
Hackney Coach.
Hackney Chariot.
Glass Coach.
Hansom's Cab.
Street Cab.
Fly.
Hearse.
Caravan.

E. CARTS AND WAGGONS OF ALL KINDS, NOT BEING AGRICULTURAL.

VI. *Manufacturing Machines and Tools, or Systems of Machinery, Tools, and Implements employed for the undermentioned purposes.*

A. MANUFACTURES OF ALL SPUN, WOVEN, FELTED, OR LAID FABRICS.
- 1. Machinery for the complete formation from the Raw Material of all Fabrics of Cotton, Wool, Flax, Hemp Silk, Caoutchouc, Gutta Percha, Hair.
- 2. Paper-making and Staining.
- 3. Printing and Bookbinding.

B. MANUFACTURES OF METALS.
- 1. The manufacture of Metals from the Ore into Bars, Rods, Wire, Sheets, and other general forms; also casting and polishing of Metal, &c.
- 2. The cutting and working of Metals by Machine Tools, such as Lathes; Machines for Planing, Drilling, Boring, Slotting, Sawing, Stamping, Shearing, Riveting, Punching.
- 3. Machines and Tools used by the Makers of Gold, Silver, and Plated Goods.
- 4. Machines and Tools used by the Makers of Cutlery, Nails, Screws, Pins, Needles, Buttons, and metallic Pens, &c.
- 5. Machines and Tools used by Locksmiths, Diesinkers, &c.

C. MANUFACTURES OF MINERAL SUBSTANCES AND MINING MACHINERY. (See also SECTION I.)
- 1. Machines and Tools for the preparation and working of all kinds of Glass, Stone, Granite, Alabaster, Slate, Clay, &c.
- 2. Machines and Tools used in the preparation and working of Gems, &c.

D. MANUFACTURES OF VEGETABLE SUBSTANCES.
- 1. Machines and Tools for the preparation and working of all kinds of Wood.
- 2. Mills and other machinery for Grinding, Crushing, or Preparing Vegetable Products.

E. MANUFACTURE OF ANIMAL SUBSTANCES.
Machinery and Tools for working in Horn, Bone, Ivory, Leather, &c.

F. MACHINERY AND APPARATUS FOR BREWING, DISTILLING, AND MANUFACTURING CHEMISTRY.

VII. *Civil Engineering, Architectural, and Building Contrivances.*

A. FOUNDATIONS AND BUILDING CONTRIVANCES CONNECTED WITH HYDRAULIC WORKS.
- 1. Application of the Screw Pile for the Foundations of Piers, Jetties, &c., Beacons, and Ships' Moorings.
- 2. Pneumatic Piling, Machinery illustrative of the mode of sinking and guiding the Cylinders, also Contrivances for overcoming difficulties where obstructions are offered to their sinking.
- 3. Coffer-dams on soft and rock bottoms, and Apparatus connected with them.
- 4. Foundations of Lighthouses exposed to the violent action of the sea.
- 5. Diving-bells, Helmets, and Apparatus connected with them.
- 6. Boring Tools, and Contrivances for ascertaining the stratification on Sites of intended Structures.

B. SCAFFOLDING AND CENTERINGS.
- 1. Scaffolding for the erection of Brick Chimney Shafts, Columns of Masonry, Towers, and Spires.
- 2. Portable Scaffoldings, Ladders, and Fire Escapes.
- 3. Scaffolding for the erection of Monolithic Blocks, as Obelisks, &c., and for the hoisting of great Weights.
- 4. Fixed and Turning Scaffolding for the repairs, &c., of Domes, &c., internally and externally.
- 5. Scaffolding and Contrivances for the erection of large Girder Bridges (as Britannia Bridge).
- 6. Centerings for Arched Bridges, Domes, and Vaults.
- 7. Centerings for Tunnels, Shields, and Contrivances for facilitating their excavation.

C. BRIDGES, TUNNELS, AND ENGINEERING CONTRIVANCES FOR CROSSING RIVERS, RAVINES, &c.
- 1. Timber Bridges.
- 2. Cast-iron Bridges.
- 3. Wrought-iron Bridges (Girder or Lattice).

4. Turning or Swing Bridges.
5. Lifting or Bascule Bridges.
6. Draw and Rolling Bridges.
7. Suspension Bridges.
8. Temporary Bridges. (See also VIII. M.)
9. Floating Bridges, as across the Hamoaze, and to receive Railway Trains, as across the Humber.
10. Examples of Brick and Stone Bridges.

D. Dock, Harbour, River, and Canal Works.

1. Docks and Slips for the building and repair of Ships.
2. Mercantile Docks, and Arrangements connected therewith, for the loading and unloading of Ships.
3. Sea and Canal Locks, Gates and Entrances, Stop-gates, Sluices, &c.
4. Marine Railway Slips and Hydraulic Docks.
5. Harbours of Refuge.
6. Breakwaters, Piers, Jetties, Wharfs, and Landing-piers.
7. Groynes, Sea-defences, &c.
8. Perpendicular Lifts for Canals, and other Engineering Contrivances instead of Locks.
9. Dredging-machines, Hedgehogs, and other Machines employed in Harbour Works, for removing Shoals, &c.

E. Lighthouses and Beacons.

F. Roofs, Buildings, and Contrivances for covering large Areas.

1. Examples of Timber and Iron Trusses.
2. Roofs for Markets, Railway Stations, &c.
3. Roofs for Theatres.
4. Fire-proof Buildings, arranged so as to be applicable to the economical methods of construction.
5. Coverings for Roofs.

G. Water-Works, and the Engineering Contrivances connected with the Obtaining, Storing, and Distribution of Water in Towns.

1. Well-sinking and Boring, and the Apparatus connected therewith.
2. Storing, Filtering, and Distributing Reservoirs, and the Contrivances connected with them.
3. Contrivances for maintaining and producing efficient Heads, and the Apparatus connected with Street Mains.
4. Services, and Apparatus connected with Domestic Water Supply. (See also V., B.)

H. Gas-Works, and Contrivances connected with the economical Production of Artificial Light.

1. Retorts and Distillatory Apparatus.
2. Condensing, Separating, and Purifying Apparatus.
3. Governors and Station Meters
4. Gauges, Valves, and contrivances connected with the Mains for the Distribution of Gas. (See also XXII.)

I. Sewerage, Cleansing, Paving, and the Contrivances connected with the Sanitary Condition of Towns.

1. Forms of Sewers, their Entrances and Junctions
2. Contrivances for Cleansing, Flushing, and Ventilating Sewers.
3. Contrivances for removing and distributing Sewage.
4. Traps, and other means of preventing emanations. (See also XXII.)
5. House Drains, and the Internal Sanitary arrangements of Houses. (See also XXII.)
6. Pavements.

J. Warming and Ventilating Domestic Residences, and the Contrivances connected therewith.

1. Arrangements for Warming, as with Hot Air, Water, Steam, &c.
2. Contrivances for preventing Smoke, and Chimney-sweeping Machines.
3. Contrivances for Ventilation on a large Scale.

K. Miscellaneous.

VIII. *Naval Architecture, Military Engineering; Ordnance, Armour, and Accoutrements.*

A. Illustrations by Models of Shipbuilding for Purposes of Commerce.

1. Ships.
2. Barks.
3. Brigs and Brigantines.
4. Snows and Ketches.
5. Schooners.
6. Sloops and Cutters.
7. Luggers, Barges, &c.

B. Illustrations by Models of Shipbuilding for Purposes of War.

1. Ships of the Line.
2. Frigates.
3. Sloops, Corvettes, and Brigs.
4. Cutters, Brigantines, Ketches, Schooners, Barges, &c.
5. Bomb or Mortar Vessels, Fire-ships, Gun-boats, &c.

C. Illustrations by Models of Shipbuilding for the application of Steam or other Powers.

1. Great War Steamers.
2. Steam-vessels of large burden for long Passages.
3. Steam-vessels for Inland, River, or Lake Navigation.
4. Sailing-vessels fitted for the temporary appliance of Steam or Human Power.
5. Miscellaneous.

D. Vessels used for Amusement, and Small Vessels generally.

1. Seagoing Yachts of all kinds.
2. River Yachts, and Pleasure Boats of a smaller class.
3. Rowing Boats of all kinds.
4. Fishing Boats and Vessels.
5. Life Boats and Paddle-box Boats.

E. Rigging, Anchors, Windlasses, Capstans, Sheathing, and Articles connected with practical Seamanship and the saving of Life from Shipwreck.

F. Infantry Army-Clothing and Accoutrements.

G. Cavalry Army-Clothing and Accoutrements.

H. Camp Equipage, such as Marquees, Tents, &c.

I. Naval Gunnery, and Weapons of Attack and Defence more especially adapted to Naval Purposes.

J. Artillery Equipments, both in Garrison and the Field, Machines for Mounting and Dismounting Ordnance.

1. Garrison Equipments.
2. Field Equipments.
3. Machinery for Mounting and Dismounting and transporting Ordnance, Carriages, &c.

K. Ordnance and Projectiles.

1. Guns.
2. Howitzers.
3. Mortars.
4. Shots, Shells, and other Projectiles.

L. Small Arms.

1. Rifles.
2. Muskets.
3. Carbines.
4. Pistols.
5. Lances.
6. Swords.
7. Bayonets.
8. Cartridges.

M. Military Engineering, Field Equipments, Methods of Passing Rivers and other Obstacles, the Attack and Defence of Fortresses, and Field Fortification.

1. Field Engineer Equipments.
2. Military Bridges, Pontoons, Rafts, Boats, &c.
3. Field Fortification and Materials used in the attack and defence of Fortresses.
4. Permanent Fortification.

IX. *Agricultural and Horticultural Implements.*

A. Implements for Tillage.

1. Ploughs, including Subsoil Ploughs and Pulverisers.
2. Harrows.
3. Sacrifiers, Cultivators, and Grubbers.
4. Clod Crushers and Norwegian Harrows.
5. Rollers.
6. Digging and Trenching Machines.

B. Drilling, Sowing, Manuring, and Hoeing Machines.

1. Pressers.
2. Drills.
3. Dibblers.
4. Horse Hoes.
5. Broadcast Sowing Machines.
6. Contrivances connected with the distribution of Manure.

C. HARVESTING MACHINES.
1. Machines for cutting Corn or Grass.
2. Tedding Machines for Hay.
3. Rakes for Hay, Corn, Stubble, &c.

D. BARN MACHINERY.
1. Steam Engines, and Water-power Machines.
2. Horse Works.
3. Thrashing Machines.
4. Straw Shakers.
5. Winnowing, Corn Cleaning, and Barley Hummelling.
6. Crushing and Splitting Mills.
7. Flour and Meal Mills.
8. Chaff Cutters.
9. Corn Weighing and Meters.
10. Gorse Bruisers and Cutters.
11. Chicory Cutters.
12. Cider Presses.

E. FIELD, FOLD, AND YARD MACHINERY.
1. Turnip-cutters.
2. Root Grating and Squeezing Machines.
3. Potato-washers.
4. Steaming Apparatus.
5. Feeding Apparatus.
6. Weighing Machines for Cattle, &c. (See G.V.)
7. Watering Engines, for Fire or Garden Purposes. (See D. V.)
8. Contrivances connected with the Stack-yard and Storing.
9. Contrivances for Fencing, Folding, &c.
10. Fittings for Stables, Cow-houses, &c.

F. AGRICULTURAL CARRIAGES, HARNESS, AND GEAR.
1. Waggons, Carts, &c.
2. Brakes.
3. Separate parts, as Wheels, Axles, &c.
4. Harness and Gear.

G. DRAINAGE IMPLEMENTS.
1. Machines for making Pipes, Tiles, and Bricks.
2. Implements for Draining, and Tools.
3. Tiles, Pipes, and other Materials used in Draining.
4. Scoop Wheels and other Machines used in Draining or Lifting Water.
5. Machines and Contrivances for Irrigating Lands.
6. Sluices, Draw Gates, &c.

H. DAIRY IMPLEMENTS.
1. Churns.
2. Cheese-presses.
3. Miscellaneous Contrivances used in the Dairy.

I. MISCELLANEOUS IMPLEMENTS USED IN AGRICULTURE.
1. Rick Ventilator.
2. Ladders.
3. Pitch and Tar Melters.
4. Sheep-dipping Apparatus.
5. Farm Railway.
6. Models of Farm Buildings.
7. Alarm Gun for Protecting Crops.
8. Beehives.
9. Instruments for Cattle, Probangs, &c.
10. Tree Remover.
11. Various Miscellaneous Articles.

J. GARDEN ENGINES AND TOOLS.

X. *Philosophical Instruments, and Processes depending upon their use: Musical, Horological, and Surgical Instruments.*

A. INSTRUMENTS FOR THE MEASUREMENT OF SPACE.
1. In fixed observatories, as Transits, Transit Circles, great Quadrants, Mural Circles, Zenith Sectors, Altarimeters, Equatorials, Collimators, &c.
2. For Nautical Astronomy and Observations, as Sextants, Reflecting and Repeating Circles, Dip Sectors, &c.
3. Astronomical and Topographical Illustrations, as Globes, Orreries, Planetariums, Maps, Charts, &c.
4. Optical Instruments, as great Refracting and Reflecting Telescopes, with their appurtenances, equatorial motions, &c.
5. Apparatus subordinate to Graduated Instruments, as divided Object Glasses and Heliometers, Eye-pieces, Micrometers, Micrometer Microscopes, &c.
6. Survey Instruments.
   - a. Topographical, as Base Apparatus, Theodolites, Repeating Circles, Geodetic Signals, Levelling Apparatus, Miners' and Prismatic Compasses, Pocket Sextants, Perambulators, Pedometers.
   - b. Hydrographical, as Sounding Machines, Patent Logs, Current Meters, Silometers.

A. INSTRUMENTS TO MEASURE THE EFFECTS OF MECHANICAL AND PHYSICAL FORCES.
1. Mechanical, as Dynamometers, Tachymeters.
2. Mass (Weighing Instruments), as Weighing Machines, Scales, Chemical and Assay Balances.
3. Density, as Areometers and other Instruments to determine Specific Gravity, Invariable Pendulums, Atwood's Machine.
4. To measure other Physical Effects, including Meteorological Instruments, as Barometers, Hydrometers, Eudiometers, Thermometers, Pyrometers, Electrometers, Rheometers, Magnetometers, &c.

C. INSTRUMENTS TO ILLUSTRATE THE LAWS OF MECHANICAL AND PHYSICAL SCIENCE.
1. "Kinematics,"—Instruments to exhibit and describe Motions and their Combinations, as Compasses, Pentagraphs, Instruments for describing Elliptical and other Figures, &c.
2. Mechanics, or Instruments to illustrate the Laws of Static and Dynamic Forces.
   - a. Stereo-Mechanics, as for illustrating Mechanical Powers, accelerated and retarded Motion, Equilibrium and Parallelogram of Forces, Levers, Cathetometers, Centripetal and Centrifugal Forces, Elasticity, &c.
   - b. Hydro-Mechanics, as Instruments to illustrate the Motion and Impinging Force of Waves, &c.
   - c. Pneumo-Mechanics, as Apparatus connected with the Air-Pump, &c.
3. Instruments to illustrate the Laws of Corpuscular Forces, as Whitworth's Planes, Endosmometers, &c.
4. Instruments to illustrate the Laws of Sound.
5. „ „ „ Light.
6. „ „ „ Heat.
7. „ „ „ Electricity, including Voltaic and Thermo-Electricity, Magnetism, Electro-Magnetism, Magnetic Electricity, Dia-Magnetism, &c.

D. APPLICATION OF MECHANICAL AND PHYSICAL SCIENCE TO USEFUL PURPOSES, NOT INCLUDED IN ANY OF THE PRECEDING OR SUBSEQUENT SECTIONS.
1. Mechanics.
   - a. Stereo-Mechanics } when not included in Sections
   - b. Hydro-Mechanics } describing their more extended uses.
   - c. Pneumo-Mechanics, as Air Pumps, Rarefying and Condensing, Diving Bells, Air Balloons, &c.
2. Sound (not including Musical Instruments).
   - a. Instruments to assist Hearing.
   - b. Alarums, Bells.
   - c. Models of Acoustical Buildings, &c.
3. Light—Instruments to assist Vision, as smaller Telescopes, Opera Glasses, Spectacles, Microscopes, Lenses, Mirrors, Signals, Visual Telegraphs, Lighthouses, Optical Illusions, Gas and Solar Microscopes, Cameras, Photography, Polarization of Light, &c.
4. Heat—Apparatus for producing Heat, for Freezing, Thermostats, Burning Lenses, and Mirrors, &c.
5. Magnetism and Electricity—Mariner's Compasses, Electric and Electro-Magnetic Telegraphs, Electric Light, applications of Electro-Magnetism as a Motive Power, Therapeutic applications of Electricity, Electrotype Apparatus and Specimens, &c.

E. CHEMICAL AND PHARMACEUTICAL APPARATUS.

F. MISCELLANEOUS.

X. *a. Musical Instruments, &c.*

A. WIND INSTRUMENTS.

Wood—
Flutes (also in Metal, &c.)
Flageolets.
Oboes.
Clarinets.
Bassoons.
Serpents.

2. Metal—
French Horns.
Trumpets.
Bugle Horns.
Cornets à Pistons.
Cornopeans.
Trombones.
Ophicleides.

B. Stringed Instruments.

Harps.
Guitars.
Violins.
Violas.
Violoncellos.
Double Basses.

C. Keyed Instruments with fixed Tones.

Organs.
Pianofortes.
Seraphines.
Harmoniums.
Concertinas.
Accordions.

D. Instruments of Percussion.

1. Drums—
   Bass Drums.
   Kettle Drums.
   Side Drums.
   Tambourines.
2. Cymbals—
   Triangles.

Automatic Instruments.
   Mechanical Organs.
   Musical Boxes, &c.

Miscellaneous Articles in connexion with Musical Instruments.
   Tuning Forks, Tuning Hammers, Pitch Pipes, &c.
   Wire Strings, Catgut Strings, &c.

G. Musical Diagrams.

X. b. *Horology*.

A. Great Clocks for Churches, Castles, Stables, and Public Buildings in general.

1. With 3 and 4 wheel Trains.
2. With Remontoires and with various Escapements.
3. To strike the Hours, and the Hours and Quarters.
4. The various Compensation Pendulums in use.
5. The various modes of making the Work to carry the Hands, and communicating the motion from the Clock to the Hands.
6. Electric or Magneto-electric Clocks.

B. Astronomical Clocks.

1. The various Escapements employed.
2. The various Compensation Pendulums used.
3. Equation Clocks.
4. Clocks, commonly called Journeymen Clocks, for Observatories.

C. Clocks applied in Registration.

1. To register the Barometer daily for twelve months, or other periods.
2. To register Tides and Winds.
3. To register the punctual attendance of Watchmen and others.

D. Clocks showing different Phenomena.

1. Cycle of the Sun and Moon, Eclipses, Moon's Age, Equation of Time, the Golden Number, Tides, &c.

E. Clocks for the Common Purposes of Life.

1. Weight Clocks.
2. Spring Clocks with Pendulums.
3. Balance Clocks of various descriptions.

F. Clocks and Time-pieces in Decorated Cases, commonly called Ornamental Clocks, for Drawing-rooms, Libraries, &c.

1. In Metal Cases, Gilt and Lacquered.
2. In Buhl Cases.
3. In Wood Cases.
4. In China Cases.

G. Sundries applicable to Clocks.

1. The various modes by which Clocks are kept going while being wound.
2. The various Escapements employed in Clocks of different descriptions.
3. Various portions of Mechanism forming parts of, or applicable to, Clocks.

H. Marine Chronometers.

1. Eight-day.
2. Two-day.
3. Thirty-hour.
4. The various descriptions of Compensation Balances applied to Chronometers.
5. The various descriptions of Pendulum Springs applied to Chronometers.
6. Pocket Chronometers.

I. Pocket Watches of various descriptions.

1. For measuring Minute Portions of Time and registering Observations.
2. With Compensation Balances.
3. „ Duplex Escapement.
4. With Horizontal Escapement.
5. „ Lever Escapement upon different constructions.
6. „ the old original Vertical Escapement.
7. Repeaters upon different constructions to strike the Hours and Quarters.
8. The same to strike the Hours, Quarters, and Half-quarters.
9. The same to strike the Hours, Quarters, and Minutes.
10. Clock-watches to strike the Hours and Quarters in a similar manner to Clocks.
11. Clock-watches, and, in addition, Repeaters.
12. Watches with Alarums.
13. Watches known by the denomination of Ladies' Watches, with the Cases decorated in various ways.
14. Various portions of Mechanism forming parts of Watches.

J. Watches for different Markets—

1. As for Turkey, with three Cases and Turkish Dials.
2. For China, with peculiar Cases and Dials.
3. For India and South America.
4. For Home Country districts.

K. Miscellaneous.

X. c. *Surgical Instruments*.

A. For Operations on the Eye.

Special Instruments for—
1. Operation on the Eyelids.
2. Fistula Lachrymalis.
3. Strabismus.
4. Artificial Pupil.
5. Cataract.
   By Depression.
   By Extraction.
   a. Including Elevators in Silver and Ivory, Fine Bistouries, Trocars, Canulas, Styles, Sounds, various Needles, &c.
   b. Cataract Knives, Hooks, Capsular Forceps, &c.

B. Operation on the Ear.

Special Instruments for—
1. Exploration of the Aural and Eustachian Passages.
   a. Sounds, Catheters, Speculums, &c.
2. The Conveyance of Air or Liquid into the Tympanic Cavity.
   b. Pneumatic and other Syringes in Metal, Glass, Caoutchouc, &c.
3. The Removal of Foreign Bodies from the Meatus.
   a. Levers, Branch Forceps, &c.
4. Perforation of, and other Operations on, the Membrana Tympani.
5. The Conduction of Sound.
   a. Including all kinds of Acoustic Instruments and Contrivances, Ear Cornets, Speaking Trumpets, &c.

C. Operations on the Nose—Nasal Fossæ and Antrum.

Special Instruments for—
1. The Removal of Polypi.
   a. Various Forceps, Porte-ligatures, Serre-nœuds, &c.
2. The Removal of Extraneous Substances.
3. The Arrest of Hæmorrhage from the Posterior Nares.
   a. Including all Contrivances for "Tamponnement."
4. Exploration and Injection of the Maxillary Sinus.
   a. Including Jourdain's Sounds, Catheters, &c.
5. Perforation and Injection of the Antrum.
   a. Including Liston's Drills, Antrum Syringes, Plugs, &c.

D. Operations of the Mouth and Pharynx.

Special Instruments for—
1. Hare Lip.
2. Operations on the Teeth (Dental Instruments).
3. Myotomy and Ligature of the Tongue.
4. Cleft Palate and other Operations on the Roof of the Mouth (Staphyloraphic Instruments).
   a. Including Obturators, Cleft and Notched Needles, Palate Holders, Porte-Sutures, &c.
5. Excision of the Uvula and Tonsils.
6. Cauterisation and other Operations on the Pharynx.

    - *a.* Tonsillar Guillotines, Pharyngotomes, &c.
- 7. Salivary Fistula.
    - *b.* Parotidean Canulas, Leaden Threads, &c.

E. Operations on the Thorax and Respiratory Organs.

Instruments for—

- 1. Tracheotomy and Laryngotomy.
    - *a.* Including Marshall Hall's Tracheotome, Sampson's Springs and Tubes, &c.
- 2. The Removal of Foreign Bodies from the Larynx, Trachea, and Bronchi.
- 3. Paracentesis Thoracis (Empyema).
- 4. Various Purposes.
    - *a.* Including Inhalers for the administration of Chloroform, Æther, and other Medicinal vapours. *b.* Instruments used to restore Suspended Animation. *c.* Respirators in all Materials.
- 5. Physical Examination of the Chest.
    - *a.* Instruments for Auscultation, Percussion, and Admeasurement of the Chest; Stethoscopes and Pleximeters in all materials; Spirometers and Stethometers, as suggested by Quain and Sibson, &c.

F. Operations on the Abdominal Walls and Alimentary Canal.

Special Instruments for—

- 1. Stricture and other morbid states of the Œsophagus, the removal of Foreign Bodies, &c.
    - *a.* Including Œsophagus Bougies and Probangs in elastic gum and other materials, Œsophagotomes, Gullet-forceps, &c.
- 2. The introduction and withdrawal of Fluids from the Stomach; the removal of Poison, &c.
    - *a.* The Stomach Pump and its appendages, Enema Syringes, &c.
- 3. The formation and maintenance of artificial Anus.
    - *a.* Enterotomes, Porte-Sutures, &c., by Dupuytren, Blandin, and others.
- 4. Prolapsus Ani.
    - *a.* All kinds of Rectum-Plugs, in metal, elastic gum, &c.
- 5. Fistula, Fissures, and Vegetations in Ano.
    - *a.* Fistula Knives, Directors, &c.
    - *b.* Porte-ligatures (on Luke's and Sampson's plan).
- 6. Hernia.
    - *a.* Cutting Instruments for its radical cure.
    - *b.* Trusses and all artificial means of support.
- 7. Paracentesis Abdominis.
- 8. Physical examination of the Rectum.
    - *a.* Various Speculums (by Hilton and others).

G. Operations on the Genito-Urinary System in the Male.

Instruments for—

- 1. Lithotomy.
    - *a.* Including Lithotomes, Gorgets, Staffs, Forceps, Scoops, &c.
- 2. Lithotrity.
    - *a.* Lithotrites, which disintegrate the Stone by Perforation.
      Ditto ditto by Concentric Pressure.
      Ditto ditto by Percussion.
    - *b.* Syringes and other Instruments to inject and explore the Bladder.
    - *c.* Dilators, Sliding-scoops, and Apparatus to remove Calculi impacted in the Urethra; Instruments for Lithectasy, &c.
- 3. Urinary Fistula.
    - *a.* Including all Urethroplastic Instruments, Urethrotomes, &c., for Recto-Urethral, Perineal, and Recto-Vesical Fistulæ.
- 4. Stricture, Prostatic and Vesical Disease, and retention of Urine.
    - *a.* Every variety of Catheter, Bougie, Sound, Porte-Caustique, and Urinal; Curved Trocars for Puncture of the Bladder above the Pubes, through the Rectum, &c.
- 5. Phymosis.
    - *a.* Apparatus employed by Jews. *b.* By the Profession.
- 6. Hydrocele.
- 7. Variocele.
    - *a.* Including Instruments for obliteration of the Spermatic Veins (Ricords'), as well as those for simple support; Suspensory and other Bandages; Scrotal Rings, &c.

H. Operations on the Genito-Urinary System in the Female.

Instruments for—

- 1. Exploration.
    - *a.* Including Speculums in all Materials, Sounds, Dilators, &c.
- 2. Operations on the Uterus, Vagina, and Cervix Uteri.
    - *a.* Hysterotomes and Instruments for Paracentesis Uteri (Lisfranc's and Simpson's), Uterine Scissors and dressing Forceps (curved and straight), Porte-Caustiques, &c.
- 3. Polipus Uteri.
    - *a.* Vulcella and other Forceps, Porte-ligatures, Serre-nœuds, &c.
- 4. Prolapsus and Procidentia Uteri.
    - *a.* Including Pessaries, Bandages, and artificial support of all kinds.
- 5. Vesico-Vaginal Fistula and Recto-Vaginal Fistula.
    - *a.* Hancock's new Instruments, Urinary Receptacles, &c.
- 6. Obstetrical Purposes.
    - *a.* Including all Midwifery Instruments, and Contrivances to remedy Lacerated Perineum.

I. Operations on the Extremities.

Special Instruments for—

- 1. Amputations.
    - *a.* Army (portable) and Hospital Cases, &c.
- 2. The Adjustment of Fractures.
    - *a.* Including Splints, Inclined Planes, Pads, Slings, and Bandages, in all Materials.
- 3. The Reduction of Dislocations.
    - *a.* Pulleys, Rings, Staples, &c.

K. Operations on the Osseous System.

Special Instruments for—

- 1. Trepanning.
- 2. Resection and Exarticulation.
- 3. The Extraction of Sequestra, &c.

L. Operations on the Vascular System.

Instruments for—

- 1. Venæsection.
    - *a.* Cupping Instruments, Lancets, Leech tubes, &c.
- 2. The Control of Hæmorrhage.
    - *a.* Tourniquets, Compressors, Torsion Forceps, &c.
- 3. Transfusion.
- 4. Aneurism.
    - By Ligature:—*a.* Aneurism Needles, Porte-ligatures, Sampson's Speculum, &c.
    - By Compression:—*b.* New Instruments, by Wyld, Bellingham, and others.
- 5. Nævus.
    - *a.* Needles, Porte-aiguilles, &c. (Liston's and Brodie's).
- 6. Varices.
    - *a.* Including Elastic Bandages, Stockings, Anclets, &c.

M. Autoplastic and Orthopædic Operations.

Special Instruments for—

- 1. The various Taliacotian Processes.
    - *a.* Rhinoplasty.
    - *b.* Chiloplasty, &c.
- 2. Tenotomy and Myotomy.
    - *a.* Including long-bladed Knives for the subcutaneous division of Muscles and Tendons, &c.
- 3. Mechanical Compensation of Lost Parts.
    - *a.* Artificial Eyes, Noses, Ears, Chins, Palates, Teeth, Hands, Arms, Legs, &c.
- 4. Orthopædic Processes.
    - *a.* Including all Orthopædic Apparatus, Back and Leg Boards and Irons, Stays, Belts, Supports, Suspenders, Boots, Shoes for the cure of Bunions (Lanagan's).

N. Dressing Instruments.

a. Surgeons' Pocket Cases and their usual contents; Spring Bistouries, Tenaculums, Scalpels, Scissors, Forceps, Spatulæ, Probes and Directors, Needles, Ligature-Silks, &c.

O. MISCELLANEOUS PHILOSOPHICAL APPARATUS APPLIED TO THE INVESTIGATION AND TREATMENT OF DISEASE.
a. Microscopes, Engiscopes, and Lenses; Urinometers and Thermometers; Volta-electric Apparatus; various illuminating Speculums; Instruments in India Rubber for the application of Intense Cold; Hooper's Water Cushions for the reception of fluids of any temperature; Spongio-piline, Patent Lint, Plaisters, Collodion, Nipple Shields, Breast-pumps, &c.

P. SURGICAL TABLES, BEDS, MATTRESSES, CHAIRS, CRADLES, RESTS, &c.

Q. POST MORTEM AND DISSECTING INSTRUMENTS, AND INSTRUMENTS FOR EMBALMMENT.

R. INSTRUMENTS APPLIED TO VETERINARY PURPOSES.

MANUFACTURES.

XI. *Cotton.*

A. COTTON YARN AND THREAD.
1. Grey Twist in Hanks and Bobbins, from No. 20 to 600.
White and Bleached Yarn.
Dyed Yarn, assorted Colours.
" Turkey-red and Pink.
2. Cotton Thread.—
Two-fold Lace; 2, 3, 4, 6, and 9-cord sewings.
Two-fold Lisle; knittings.
Crochet Cottons.
Wire Thread.
3. Crape Yarn—
Bleached.
Coloured.

B. CALICOES.
Sheetings (Grey and Bleached)—
⅞ and 9/8 Super.
Shirtings (Grey and Bleached).
Domestics.
Madapollams—
⅞ and 9/8, and 40-inch Printers'.
Long-cloths (Plain and Twilled) -
Imitation Irish.

C. CORDS AND BEAVERTEENS.
1. ½ ell and ¾ Cords.
Genoa.
Beaverteens.
2. Drabbetts.
Twilletts.
Fancy Drills.
Grey Twills.
Swansdowns.
Jeans.
Ticks.
3. Velvets and Velveteens.

D. MUSLINS, &c.
1. Cambric and Jaconnet—
Mulls and Books.
Bishop and Victoria Lawns, &c.
Jaconnet, Organdies, Lenos, and Fancy Checks for Printing (Grey and Bleached).
2. Figured Muslins—
Lappets, Lenos, and Netts, White and Dyed.
Jacquard-made Goods.
Lappets, Japan Spots and Honeycombs.
" Striped and Corded.
" Allover and Diagonal Spider.
" Bengal Scarf Spot, assorted.
Harness, assorted.
" Garments.
Window Curtains.
" Spot.
Book Jaconnet and Dacca Lappets.
Lenos, Plain.
" Figured.
Small Stripe and Check Doriahs.
Mexican Lappets, Coloured and White.

The same in its dyed state	

13. Musquash, or large North American Rat, for Ladies' wear, as for Muffs, Boas, &c.

Hamster	As for Muffs, Tippets, Linings, Cuffs, &c.
Opossum	
Perewiazka	

14. Hare and Rabbit.

White Hair from Russia and the Polar Regions	Muffs, Tippets, Linings, Cuffs, &c.
European or Grey Hare	
Hudson's Bay and North American Rabbit	
English Rabbit	
Flemish Rabbit	
Silver Grey Rabbit	
White Polish Rabbit	
Black and Blue Rabbit	
Australian Rabbit	
Dyed Rabbit	

15. Lamb, &c.

Grey Russian Crimea Lamb	For general purposes of Dress.
Black Ukraine Lamb	
Black Astrachan Lamb	
Persian Grey Lamb	
Persian Black Lamb	
Hungarian Lamb	
Spanish Lamb	
English Lamb	

16. Squirrel.

Black Russian	For Ladies' wear, and for Muffs, Tippets, Cuffs, Linings, Trimmings, &c.
Blue Siberian	
Kazan Siberian	
American Squirrel	
English Squirrel	
Indian Striped Squirrel	
Flying Squirrel	
Dyed Squirrel	

17. Chinchilla.

African Chinchilla	As made into various articles of Ladies' Dress.
Buenos Ayres Chinchilla	
Lima or bastard Chinchilla	

18. Cat.

Dutch Cat or Jennet	For Coat Linings, Sleigh Coverings, Travelling &c.
European Cat	
Wild Cat	
African Cat	

19. Grebe	For Ladies' use.
Eider Duck	
Penguin	

20. Tartar Foal	Various purposes.
Angora Goat	
Dyed Goat	

21. Skins from the Tropics.

Lion	Mounted for Ornamental purposes and for Furniture.
Royal Tiger	
Cape Tiger	
Leopard	
Panther	
Zebra	
Antelope	
Black Monkey	
Anteater	

22. Miscellaneous—Moose Deer.
Deer.
Roebuck.
Badger; the hair of the European badger, as used for shaving-brushes, &c.
Mole, as made into articles of Ladies' apparel.

E. FEATHERS.

1. Ostrich.

Aleppo	As worn in Plumes on Court occasions by Knights of various Orders, and for Military purposes, also in their application to general Dress for Ladies and for Funeral Plumes.
Magador	
Alexandria	
Senegal	
Cape	
Algoa Bay

F. HAIR.

1. Hair as a substitute for Human Hair, as Wigs, Curls, Fronts, &c.
2. Ornaments in Hair, as Plumes, Bracelets, Guards, &c. (See also XXIII. C.)
3. Hair Cloth for the purposes of Furniture.
4. Hair for miscellaneous purposes, as for stuffing Furniture.

XVII. *Paper and Stationery, Printing, and Bookbinding.*

A. PAPER IN THE RAW STATE AS IT LEAVES THE MILL.

1. Brown Paper and Packing Papers.
2. Millboards and Glazed Boards for pressing.
3. Printing Papers.
4. Drawing Papers.
5. Writing Papers.
6. Tissue Papers, white and tinted.
7. Papers tinted in the Pulp.
8. Tracing Papers, made so in the Pulp.
9. Papers ornamented in the Water-mark.
10. Cartridge Paper.

B. ARTICLES OF STATIONERY.

1. Envelopes, plain and ornamental.
2. Embossed and Lace Papers.
3. Printed Fancy Papers and Surface-coloured Papers, Printed and Embossed Ornaments.
4. Wedding Stationery (Cards, Papers, and Envelopes).
5. Mourning Stationery (Cards, Papers, and Envelopes).
6. Specimens of Ornamenting, Glazing, and Packeting Writing Papers.
7. Sealing-wax and Wafers.
8. Pens.
9. Small Wares for Stationery.
10. Tracing Paper, made transparent by Varnishes.
11. Inks of all kinds.

C. PASTEBOARDS, CARDS, &c.

1. Playing Cards.
2. Message Cards, plain and ornamental.
3. Drawing Boards.

4. Mounting Board, plain and ornamental.
5. Pasteboard and Cardboard.

D. Paper and Scaleboard Boxes, Cartons (Cartonnerie).

All kinds of Boxes and Cases made of Pasteboard and Paper (not being Papier-maché), plain or ornamented.

E. Printing (not including Fine Art Printing).

1. Type-printing generally.
2. Printing Inks and Varnishes.

F. Bookbinding, &c.

1. Binding in Cloth.
2. " Vellum.
3. " Leather.
4. " Velvet.
5. " Wood, Papier-maché, or Metal.
6. Albums, Scrap-books, Portfolios, Music-books, Manuscript-books, Memorandum-books.
7. Ledgers and Account-books.
8. Blotting-cases, Desks, Cabinets, Pocket-books, Card-cases, Note-cases, &c.
9. Porte-monnaie, and other Articles of a similar nature.

XVIII. *Woven, Spun, Felted, and Laid Fabrics, when shown as specimens of Printing or Dyeing.*

A. Printing or Dyeing of Woollens, or any Mousseline de Soie, de Laine, or Alpaca Mixture.

1. Mousseline de Laine, de Soie, &c.—
   Made of all Wool.
   " Cotton and Wool.
   Cashmere—
   Made of all Wood.
   " Cotton and Wool.
   Barège—
   Made of Silk and Wool.
   " Cotton and Wool.
   " all Wool.
   " Cotton, Silk, and Wool.
   Balzarine, plain and figured—
   Made of Cotton and Wool.
   " Silk and Wool.
   " Cotton, Silk, and Wool.
2. Printed or Dyed Cotton or Silk Warps, afterwards woven, known as Chiné.
3. Printed Woollen Table-covers.
   " " Japanned.
4. Printed and Dyed Silks—
   India Corahs in the Grey.
   " dyed.
   " printed in England.
   India Bandanas (tied and dyed in India).
   " Choppahs (printed in India).
   British Corahs in the Grey.
   " dyed.
   " printed.
   British Twills in the Grey.
   " dyed.
   " printed.
   British Spun Silks, printed.
   British Cambrics, printed.
   " dyed.
   British Spun Silk Dresses, dyed.
   " " " printed.
   British Corah Dresses, printed.
   India Corah Dresses, printed.
   Printed China Crape Shawls.

B. Printed Calicoes, Cambrics, Muslins, Velvet, and Velveteens—

1. Cottons printed by Machines only.
   " by Block only.
   " partly by Block and Machinery.
   Turkey-red, printed or dyed.
   " " Mules.
   Muslins printed by Machinery.
   " by Block only.
   " partly by Block and Machinery.
   Prints and Furniture by Machine only.
   " by Block only.
   " partly Block and Machine.
   Handkerchiefs for the pocket, head, neck, and shoulders.
   Single Colours, blue ground, &c.
   Assorted Colours, fast and loose.
   Turkey-red, Bandanas printed.
   " " discharged.
   " Chintz pattern.
   Printed Border Handkerchiefs.
   Imitation Cambric.
   " Fancy Muslin.
   Imitation Java batticked Handkerchiefs.
   Printed Aprons.
3. Printed Shawls and Dresses.
   Shawls, assorted Colours . . } part with fringe,
   " Turkey-red, or purple } part without.
   Java Sarongs batticked.
   " Turkey-red.
   Java Slendrongs, Turkey-red, and batticked.
   Malay Chindey or Imitation.
   Bombay Patolio.
   Siam Shawls.
   Scarfs.
   Dresses.

B. Dyed Cotton Goods.

Cambrics and Madapolones, assorted Colours.
" Turkey-red.
Imitation blue Morries and Basstas.
Long Cloths of all kinds.
Mull and Book Muslin of all kinds.
Cotton Drills (blue).
Velvet.
Velveteens.

D. Dyed Linen Goods.

Printed Linens.
Cambric Handkerchiefs.
Lawn Shirt Fronts.
Lawn Hankerchiefs.

E. Dyeing or Printing of Leather, Hair, Fur, etc.

XIX. *Tapestry, including Carpets and Floor-cloths, Lace, Embroidery, Fancy and Industrial Work.*

A. Tapestry.

1. Carpets of all kinds in which the Pattern is produced by Weaving or by the Hand, in the manner of Tapestry proper, including Hall Carpets, Rugs, Stair, &c.
   a. Axminster Carpets, Flax or Jute, Chain, Woollen, or Worsted Pile, worked by hand.
   b. Table and Chair Covers, &c., worked in the same way.
   c. Patent Axminster Carpets, manufactured at Glasgow, made firstly as a woven Fringe, and that adapted afterwards to a thick Flax surface.
   d. Patent Tapestry Carpet, Pattern printed in warp, any number of Colours used; Table-covers and Curtains, made in same way.
   e. Patent Tapestry Rugs, Velvet Pile Surface, with a thick weft shoot of Cotton, Flax, or other material.
   f. Brussells and Velvet Pile Carpet.
   g. Tapestry Brussells Carpets, called Moquette, of a fine quality.
   h. Kidderminster and Venetian Carpet.
   i. Patent Mosaic Tapestry and Rugs, where the cut Wool is fixed to a ground by caoutchouc, &c.
   j. Printed Felt Carpet, Plain and Printed Druggets, Printed and Embossed Cloth for Table-covers and Curtains.
   k. Patent Printed Carpets with Terry Pile Surface; the same Moquette for Curtains or Furniture.
   l. Cloth Embroidered by Machinery for Table-covers or Curtains.
2. Matting of Hemp, Cocoa-nut Fibre, Straw, Reeds, and Grasses, for Floor and Walls.
3. Oil-cloth for Floor or Table, whether painted or printed.
4. Woven or Embroidery, Crochet and Net Work.
5. Counterpanes and Quilts for Bed-covers; Quilting and Dimity for Bed-room Hanging.
6. Ornamental Tapestry of Silk, Wool, Linen, Mohair, Cotton, or of these Materials mingled together, or with Metal Wires, whether woven in the Loom or of any kind of Needlework, but of Patterns having so much artistic excellence as to entitle them to be exhibited in Section XXX. as Works of fine Art.

B. Lace.

1. Pillow Lace, the article or fabric being wholly made by hand (known as Valenciennes, Mechlin, Honi-

ton, Buckingham); or guipure made by the Crochet Needle; and Silk Lace, called "Blonde" when white, and Chantilly, Puy, Grammont, and Black Buckinghamshire when black.

2. Lace, the ground being Machine-wrought, the Ornamentation made on the Pillow and afterwards applied to the Ground (known as Brussells, Honiton, or appliquée Lace.)
3. Machine-made Nets and Quillings, wholly Plain, whether Warp or Bobbin (known as Bobbin Net, Tulles, Blondes, Cambraie, Mechlins, Malines, Brussells, Alençon, &c.).
4. Lace, the Ground being wholly made by Machine; partly Ornamented by Machine and partly by Hand, or wholly Ornamented by Hand, whether Tamboured, Needle-Embroidered, or Darned.
5. Lace actually Wrought and Ornamented by Machinery; comprising Trimming Laces of every description, Veils, Falls, Scarfs, Shawls, Lappets, Curtains, &c.

C. Sewed and Tamboured Muslins.
- Ladies' Collars, Cuffs, &c.
- Children's Robes.
- Handkerchiefs.
- Trimmings and Insertions.
- Vest Pieces.
- Shirt Fronts.
- Mantles.
- Dresses.
- Curtains, &c.

D. Embroidery.
1. Gold and Silver and Glass.
2. Silk, as Shawls, Dresses, Mantles, Table Covers, and Curtains, &c.
3. Berlin Wool, Chair Covers and Fancy Articles for the Drawing-room.
4. Embroidery by Machinery.

E. Fringes, &c.
1. Fringes, Tassels, Gymps, &c., suitable as Trimmings for Upholstery.
2. Ditto for Dresses and other fine Work.

F. Fancy and Industrial Works.
1. Berlin Wool Work.
2. Needlework.
3. Miscellaneous Industrial Works.

XX. *Articles of Clothing for Immediate Personal or Domestic Use.*

A. Hats, Caps, and Bonnets.
1. Hats, made of Silk, Beaver, or other materials, for Men.
2. Caps, for Men.
3. Bonnets of Straw, Silk, or other material.
   - *a.* British Chip Bonnet made from the Poplar.
   - *b.* Willow Bonnet.
   - *c.* Brazilian Grass Hats.
   - *d.* Tuscan and Leghorn Plaiting and Bonnets.
   - *e.* Straw Plait Bonnets.
   - *f.* Straw Trimmings and Bonnets.
   - *g.* Horse-hair Trimmings and Bonnets.
   - *h.* Silk and other Bonnets made by Milliners.

B. Hosiery.
1. Cotton.
2. Woollen.
3. Linen.
4. Silk.

C. Gloves.
1. Made of Leather or Skins.
2. Made of any other materials.

D. Boots, Shoes, and Lasts.
1. Made of Leather.
2. Made of other materials.

E. Under Clothing.
1. For Ladies.
2. For Gentlemen.

F. Upper Clothing
1. For Ladies, including all kinds of Millinery.
2. For Gentlemen, including all kinds of Tailor's-work.

XXI. *Cutlery and Edge-tools.*

A. Cutlery, such as Knives and Forks, Pen and Pocket Knives, Razors, Scissors, and Shears.
1. Knives and Forks—
   - Table, Dessert, Carving.
   - Dessert or Fruit, with plated and silver blades.
   - Cake and Melon Carvers, „ „
   - Fish Knives and Forks, „ „
2. Spring Knives—
   - Pen and Pocket Knives of every description.
   - Hunting and Sportsmen's Knives.
3. Knives of all other descriptions—
   - Paper Knives of all kinds.
   - Desk or Office Knives.
   - Palette Knives.
   - Knives for Hunting and Self-defence, as Couteaux-de-Chasse, Bowie Knives, &c.
   - Knives for Kitchen and Domestic Purposes, as Cooks', Oyster, Onion, Bread and Butter, and Cheese Knives.
   - Knives used in various Trades, as Butchers', Shoemakers', Glaziers', Gardeners', &c.
4. Scissors and Shears—
   - Ladies' Work and Cutting-out Scissors of every description.
   - Nail, Button-hole, Barbers', and Trimming Scissors.
   - Shears used in various Trades, as Tailors', Brushmakers', &c.
   - Garden and Sheep Shears.
5. Razors of all kinds.
6. Miscellaneous—
   - Corkscrews, Button-hooks, Boot-hooks, Nail-nippers, Nail-files, Tweezers, &c.

B. Files and other small Edge Tools, not included in Manufacturing Tools in Section VI.
1. Files and Edge-tools used by Engineers, Smiths, or other Metal Workers.
2. „ for purposes of Building, by Masons, Bricklayers, and Plasterers.
3. „ for fine Metal and other work, as for Clock and Watch makers, Jewellers, Lapidaries, Engravers, and Modellers.
4. „ for Wood-work, as for Carpenters, Joiners, Cabinet-makers, Coopers, &c.
5. „ for Leather or Skins, as for Saddlers, Curriers, Shoemakers, and Bookbinders.
6. Drawing, Artists', and Engraving Instruments.
7. Files and Edge-tools for other purposes than those specified.

XXII. *Iron and General Hardware.*

A. Brass Manufacture.
1. Cabinet and general Brass Foundry, consisting of Hinges, Fastenings, Escutcheons, Bell-pulls, Brass-foundry used in Ships, Knockers, Door-springs, Castors, &c.
2. Plumbers' Brass Foundry, Cocks, Valves, Pumps, Water-closets, &c.
3. Stamped Brass Foundry, Cornices, Curtain-bands, Finger-plates, &c.
4. Gas-fittings, Brackets, Chandeliers, Pillars, Gas Burners, and Consumers' Meters, &c.
5. Tubing, plain and ornamental.
6. Metallic Bedsteads, Brass and Iron.
7. Chandeliers, Lamps, and Candelabra, for Oil, Candles, or Camphine, and Lamp Chains.
8. Railway and Carriage Brass Foundry, and Signal Lamps and Lanterns.
9. Bronze Figures, Busts, and Chimney Ornaments.
10. Bells, House, Church, Ship, Table, &c., and Alarums.
11. Candlesticks, Table and Bedroom.
12. Monumental Brasses and Ecclesiastical Brass-work.
13. Copper and Steel Plates for Engravers.
14. Miscellaneous.

B. Copper, Zinc, Tin, Pewter, and General Braziery.
1. Kettles, Coalscuttles, Coppers, Saucepans, Steamers, Plate-warmers, &c.
2. Bronzed Tea and Coffee Urns, Kettles, &c.
3. Tubing—Copper, Tin, Lead, &c.
4. Pewter, German Silver, and Britannia-metal Teapots, Basins, Dishes, Spoons, Ladles, Inkstands, &c.
5. Coffin Furniture—Plates, Escutcheons, &c.
6. Zinc Articles generally.

C. IRON MANUFACTURE. (See also I. and V.)

1. Stoves, Grates, Fenders and Fire Irons, Kitchen Ranges, Cooking Apparatus, Smoke-jacks.
2. Warming Apparatus, for Halls and Rooms, Ships, &c. either by Water, Coal, Coke, Wood, Charcoal, or Gas.
3. Shower, Vapour, Air, and Warm-water Baths.
4. Ventilators—Metallic and others.
5. Pipes and Gutters, &c.
6. Locks and Hinges.
7. General Ironmongery.
8. Ice Machines.
9. Knife-cleaning Machines.
10. Letter-copying Machines and Presses.
11. Saddlers' Ironmongery.
12. Hollow Ware, cast, and wrought, tinned and enamelled.
13. Spades, Shovels, Pickaxes, Hoes, Rakes, Garden-rollers, &c. (See also S. IX.)
14. Nails, cut, cast, and wrought, in Iron, Copper, and other Metals.
15. Screws and Railway Bolts, &c.
16. Iron Safes, Cash-boxes, fire-proof and otherwise.
17. Horse-shoes.
18. Gates, Railings, Hurdles, and Stable Fittings.
19. Mangles, Washing Machines, &c.

D. STEEL MANUFACTURE.

1. Tools and heavy Steel Toys, Hammers, Vices, &c.
2. Steel Ornaments, and light fancy Steel Toys, Brooches, Buckles, &c.
3. Steel Pens and Metallic Pens.
4. Needles, Fish-hooks, and Fishing Tackle.

E. BUTTONS, ETC.

1. Buttons—Metallic, Florentine, Pearl, Bone, &c.
2. Metal Boxes, Watch Boxes, &c.

F. WIRE WORK, &c.

1. Wire Gauze, for Window Blinds, Fencing, Pheasantry, Birdcages, &c.
2. Wire—Iron, Brass, Steel, and Copper.
3. Pins—white and black.
4. Hooks and Eyes.
5. Metallic Wire Baskets.
6. Wire Rope.

XXIII. *Working in Precious Metals and in their imitations; Jewellery, and all Articles of Virtu and Luxury not included in the other Classes.*

A. COMMUNION SERVICES.

As Altar-dishes, Flagons, Chalices, Patens, Plates, &c.

B. ARTICLES OF GOLD AND SILVER PLATE, FOR DECORATIVE PURPOSES AND PRESENTATION PIECES.

1. Racing Prizes, Testimonials, allegorical, historical, and emblematic Groups and Compositions, Shields, Centre Pieces, Vases, Tazzas, Ewers, Salvers, Candelabra, &c.
2. The same Articles made in hammered or repoussé metal.

C. SMALLER ARTICLES FOR MORE GENERAL DOMESTIC USE.

1. For the Dinner Table; as Smaller Candelabra with Branches, Candlesticks, Centre Pieces, Soup and Sauce Tureens, Covered Dishes, Smaller Mounted Dishes, Flat Dishes, Flower-stands and Epergnes, Dessert Services, Table and Dessert Knives, Spoons, and Forks, Salvers, Bread and Cake Baskets, Claret Jugs, Wine Coasters, Cruet Frames, Mustard Pots, Salts, &c.
2. Breakfast and Tea-table Service; as Tea and Coffee Urns and Kettles, Tea and Coffee Pots and Stands, Sugar Basins, Milk and Cream Jugs, Ewers and Basins, Toast Racks, &c.
3. Dressing and Library Table and Travelling Utensils; as Inkstands and Writing Appendages, Dressing Cases and Instruments, &c.
4. Miscellaneous; as Watch and Clock Cases, Toys, Pencil Cases, Seals and Keys, Filagree Baskets and Ornaments.

D. ELECTRO-PLATED GOODS OF ALL DESCRIPTIONS, COMPREHENDING ALL THAT CAN BE EXECUTED IN SILVER AND OTHER METALS.

E. SHEFFIELD AND OTHER PLATED GOODS.

Centre and Side covered Dishes and Warmers, Soup Tureens, Cruet Frames, Liqueur Frames, Pickle ditto, Candlesticks and Branches, Candelabra, Bread and Cake Baskets, Snuffers and Trays, Tea and Coffee Services, Teatrays, Hand Waiters, Claret Jugs, Decanter Stands, Sugar Stands, Flower Stands, Nut Crackers, Grape Scissors, Mustard Pots, &c.

F. GILT AND OR-MOLU WORK.

1. Gilt by the Electro process.
2. Gilt by amalgamation, or "Water Gilding."
3. Imitation Jewellery and Toys.

G. JEWELLERY.

1. Works exhibiting the Precious Stones and Pearls, as Diamonds, Rubies, Sapphires, Emeralds, Opals, Turquois; and the manner of setting them in Crowns, Coronets, Stars, Orders, Tiaras, Head Ornaments, Bouquets, Necklaces, Bracelets and Armlets, Presentation Snuff Boxes, Brooches, Ear Pendants, Medallions, Studs, and Buttons.

3. Ornaments made of Gold, whether plain or enamelled; as Bracelets, Brooches, Necklaces, Earrings, Pins, Waist-Buckles, Chains, Buckles, Studs, Châtelaines, &c. &c. &c.
4. Jewellery by imitations of Precious and other Stones.
5. Ornaments worked in Ivory, Jet, Horn, Hair, and other materials, of which the Precious Stones or Metals do not form the principal feature.

H. ORNAMENTS AND TOYS WORKED IN IRON, STEEL, AND OTHER METALS WHICH ARE NEITHER PRECIOUS METALS NOR IMITATIONS OF THEM, AS CHATELAINES OF STEEL, CHAINS OF STEEL, SWORD-HILTS, CUT STEEL SHOE AND KNEE BUCKLES, BERLIN IRON ORNAMENTS, CHAINS, NECKLACES, BRACELETS, ETC.

I. ENAMELLING AND DAMASCENE WORK.

1. Enamelling of subjects on Gold and Precious Metals. (Except when shown in the Section of FINE ARTS.)
2. Damascene Work, or insertion of one Metal in another, not included in the above-named Classes, as forming a minor ingredient in some more important species of Manufactures.

J. ARTICLES OF USE OR CURIOSITY NOT INCLUDED IN THE PREVIOUS ENUMERATION.

XXIV. *Glass.*

A. WINDOW GLASS, INCLUDING SHEET GLASS, CROWN GLASS, AND COLOURED SHEET GLASS.

1. Crown.
2. Sheet.
3. Blown Plate Glass, silvered and unsilvered.
4. Coloured Sheet, Pot Metal, or flashed.
5. Glass Ventilators.
6. Glass Shades, round, oval, and square.

B. PAINTED AND OTHER KINDS OF ORNAMENTED WINDOW GLASS.

1. Enamelled, Embossed, Etched, painted white, or coloured Window Glass.
2. Painted and Leaded Windows.

C. CAST PLATE GLASS.

1. Rough Plate.
2. Ground and polished, silvered and unsilvered.
3. Pressed Plate.
4. Rolled Plate, white and coloured.

D. BOTTLE-GLASS.

1. Ordinary Bottle-glass, including Moulded Bottles.
2. Medicinal Bottle-glass, including Phials, &c., blown and moulded, of all kinds and shapes.
3. White Bottle-glass, Blown, Pressed, and Moulded Bottles.
4. Water-pipes and Tubing.

E. GLASS FOR CHEMICAL AND PHILOSOPHICAL APPARATUS.

1. Glass for Matrass, Retorts, and other kinds of Chemical and Philosophical Apparatus.
2. Water-pipes and Tubing.

F. Flint Glass or Crystal, with or without Lead, white, coloured, and ornamented for Table Vases, etc.
1. Blown.
2. Moulded and Pressed.
3. Cut and Engraved.
4. Reticulated and spun with a variety of colours, incrusted, flashed, enamelled of all colours, opalescent, imitation of Alabaster, gilt, platinised, silvered, &c.
5. Glass Mosaic, Millefiori, Aventurine, and Venetian Glass Weights, &c.
6. Beads, imitation Pearls, &c.
7. Chandeliers, Candlesticks, and all Glass Apparatus for Lamps, Candlesticks, Girandoles, Wall Brackets, with or without drops, &c.

G. Optical Glass, Flint and Crown.
1. Rough Discs of Flint and Crown, to make Lenses for Telescopes, Microscopes, Daguerreotype and Calotype Apparatus, &c.
2. Flint and Crown, blown or cast in plates for the Optician.
3. Thin Glass for Microscopes.
4. Refractive Apparatus, Prismatic Lenses for Lighthouses. (See also Class J.)

XXV. *Ceramic Manufactures,—Porcelain, Earthenware, &c.*

A. Porcelain, Hard.
1. Chinese.
2. Japanese.
3. Continental, as Berlin, Meissen, &c.

B. Statuary Porcelain.
1. Statuary.
2. Parian.
3. Carrara.

. Tender Porcelain.
1. English Porcelain, soft or tender.
2. French, with Silicious body.

D. Stoneware, Glazed and Unglazed.
1. Ironstone, or Stone China, glazed.
2. White Stone body, unglazed.
3. Coloured body, Jasper.
4. „ Egyptian black, unglazed.
5. „ Red, „
6. „ Cane, „
7. „ Drab, „
8. Brownware, with salt glaze. (The Lambeth, Chesterfield, and Beauvais manufactures are included in this class.)
9. Chemical utensils. (These are made both in Stoneware and Hard Porcelain).

. Earthenware.
1. White body for Printing, Painting, or Enamelling in different Colours.
2. Common Cream-colour.
3. Green glazed ware.
4. Rockingham „
5. Delft ware.
6. Majolica ware.
7. Mocha and Dipped ware.
8. Common Lead glazed ditto, for utensils.
9. Coloured body, Turquoise.
10. „ Drab.
11. „ Olive.
12. „ Buff.
13. „ Cottage brown.

. Terra Cotta.
1. Vases and Garden-pots.
2. Ornaments for Architecture.
3. Encaustic or Inlaid Tiles.
4. Tesseræ of various colours, compressed from powdered clay.
5. Superior Plain Tiles for Pavements, ditto ditto.
6. „ Bricks, ditto, ditto.
7. „ Roofing Tiles, ditto, ditto.
8. Chimney Pipes.
9. Common Bricks.
10. „ Roofing Tiles, &c.

G. Ornamented or Decorated.
1. Ornamented on *Bisque*—
   Painted by hand.
   Printed and transferred in various colours.
2. Ornamented *on the glaze.*
   Painted by hand.
   Printed by the press.
   Printed by hand.
   Gold Lustre.
   Silver „
   Steel „
   Enamelling in various colours.
   Gilding.

H. Productions for Architectural Purposes.

XXVI. *Decoration Furniture and Upholstery, including Paper-hangings, Papier-maché, and Japanned Goods.*

A. Decoration generally, including Ecclesiastical Decoration.
1. Ecclesiastical Decoration generally.
2. Ornamental coloured Decoration, as executed by hand.
3. Imitations of Woods, Marbles, &c., ditto.
4. Relievo Decoration, mechanically produced.

B. Furniture and Upholstery.
1. Cabinet Work, plain.
2. Cabinet Work, carved or ornamental.
3. Marqueterie, inlaid Work, in Woods, &c.
4. Buhl or Metallic inlaid Work.
5. Chairs, Sofas, and Beds, and general Upholstery.

C. Paper-Hangings.
1. Damask Patterns.
2. Flower Patterns.
3. Flock and Metal Papers.
4. Decorative Paper-hangings by Block-work.
5. „ „ by any other Process.
6. Machine-printed Paper-hangings.

D. Papier-mache, Japanned Goods, Pearl, and Tortoiseshell Work.
1. Papier-maché, japanned, inlaid, and decorated.
2. Papier-maché (not japanned), produced in ornamental forms for decoration.
3. Japanned Goods in Iron, &c.
4. Pearl and Tortoiseshell Work.

XXVI. *Manufactures in Mineral Substances used for Building or Decoration, as in Marble, Slate, Porphyries, Cements, Artificial Stones, &c.*

. Manufactures in common Stones.
1. For Building, and constructions not strictly decorative.
2. For Decorative purposes.

B. Manufactures in Slate.
1. For Construction.
2. For Decoration.

C. Manufactures in Cement and Artificial Stone.

D. Manufactures in Marbles, Granites, Porphyries, Alabaster, Spar, etc. for useful or ornamental Purposes.
1. For Construction and external Decoration.
2. For internal Decoration (not Furniture), as Chimney-pieces, &c.
3. For articles of Furniture, as Tables, &c.
4. For purposes of mere Ornament.

E. Inlaid Work in Stone, Marble, and other Mineral Substances.

. Ornamental Work in Plaster, Composition, Scagliola, Imitation Marble, etc.

. Combinations of Iron and other Metals with Glass and other Substances for various useful pur-

1. For Architectural purposes.
2. For Miscellaneous purposes.

XXVIII. *Manufactures from Animal and Vegetable Substances, not being Woven, Felted, or included in other Sections.*

A. Manufactures from Caoutchouc.
1. Impermeable Articles.
   Boots.
   Holdsworth's Life Preservers.
   Captain Smith's Life Preservers.
   Hydrostatic and Air Beds.
   Water and Air Cushions.
   Gas Bags.
   Printers' Blankets.
   Cloaks, Capes, Coats, Paletots, &c.
   Boots and Shoes, Over Shoes, or Goloshes.
   Fishing and Deck Boots.
   Ship Sheets.
   Bellows.
   Air-pump Valves for Steam Engines.
   Sponge Baths and Bags.
   Prepared Water and Air proof Textures of every description.
2. Elastic Articles.
   Railway and other Carriage Springs, and Buffers.
   Valve Canvas.
   Knee Caps.
   Surgical Bottles.
   Pump Buckets and Valves.
   Bands and Rings for Letters and Packages.
   Writing Tablets.
   Trouser Straps.
   Gussets for Boots.
   Vest Backs.
   Washers for Flange and Socket Joints.
   Driving Bands for Machinery.
   Railway Felt.
   Wheel Tires.
   E. Smith's Torsion Springs for Window-blinds and Shades.
   Door Springs.
   Dr. Bell's Sewer and Sink Valves
   Hodge's Projectile and Lifting Straps.
   Air-pump Valves.
   Elastic Webbing.
   Cricket Gloves and Balls.
   Stoppers for Decanters, Bottles, Jars, and other vessels.
3. Articles in Caoutchouc—Moulded, Embossed, Coloured, and Printed.
   Bas-reliefs.
   Bags.
   Maps, printed on Caoutchouc.
   Sheets, in Colour.
   Embossed and Printed Ornaments.
   Garters, Bracelets, &c., Embossed, Coloured, or Printed.
   Bottles, Embossed and in Colours.
   Embossed Sheets for Seats and other Purposes.
   Vulcanized Articles combined with Metal—such as Decanter Stoppers, Inkstands, Cocks and Taps for Fluids, Hinges, Locks and Bolts, Wheel Tires, Plugs for Cisterns, Linings of Vessels, &c.

B. Manufactures from Gutta Percha.
1. For Waterproofing Purposes.
2. For Agricultural Uses, as Tubing for Manure, &c.
3. For Maritime Purposes, as Speaking Trumpets, Life Buoys, Life Boats, Cords, Tiller Ropes, &c.
4. Decorative Uses, as Ornamental Mouldings, Brackets, Medallions, Picture Frames, &c.
5. Surgical, Electrical, and Chemical Uses, as Dissolved Gutta Percha for Wounds, Stethoscopes, Splints, Ear Trumpets, &c., Carboys, Funnels, Acid Vessels, Covering of Telegraph Wire, Insulating Stools, &c.
6. Domestic and Miscellaneous Uses, as Soles for Shoes, Linings of Cisterns, Conveyance of Water and Gas, Hearing Apparatus, &c.

C. Manufactures from Ivory, Tortoiseshell, Shells, Bone, Horn, Bristles, and Vegetable Ivory.

D. General Manufactures from Wood (not being Furniture).
1. Turnery.
2. Carving, &c.
3. Coopers' Work of all kinds.
4. Basket and Wicker work.
5. Miscellaneous Wood work.

E. Manufactures from Straw, Grass, and other similar Materials.

F. Miscellaneous Manufactures from Animal and Vegetable Substances.

XXIX. *Miscellaneous Manufactures and Small Wares.*

A. Perfumery and Soap.
B. Articles for Personal Use, as Writing Desks, Dressing Cases, Workboxes, when not exhibited in connexion with Precious Metals (XXIII.), and Travelling Gear generally.
C. Artificial Flowers.
D. Candles, and other means of giving Light.
E. Confectionery of all kinds.
F. Beads and Toys, when not of Hardware, Fans, etc.
G. Umbrellas, Parasols, Walking-sticks, etc.
H. Fishing Tackle of all kinds, Archery.
I. Games of all kinds.
J. Taxidermy.
K. Other Miscellaneous Manufactures.

FINE ARTS

(*So far as they come within the limitations of the Exhibition*).

XXX. *Sculpture, Models, and Plastic Art.*

A. Sculpture as a Fine Art.
1. In Metals simple, as Gold, Silver, Copper, Iron, Zinc, Lead, &c.
2. In Metals compound, as Bronze, Electrum, &c.
3. In Minerals simple, as Marble, Stone, Gems, Clay, &c.
4. In elaborate Mineral Materials, as Glass, Porcelain, &c.
5. In Woods and other Vegetable Substances.
6. In Animal Substances, as Ivory, Bone, Shells, Shell Cameos.

B. Works in Die-sinking, Intaglios.
1. Coins, Medals, and Models of a Medallic character in any material.
2. Impressions struck from Dies for ornamental purposes.
3. Gems, either in Cameo or in Intaglio, Shell Cameos.
4. Seals, &c.

C. Architectural Decorations.
1. Integral, in Relief, Colour, &c.
2. Adventitious, as Stained Glass, Tapestry, &c.

D. Mosaics and Inlaid Works.
1. In Stone. 4. In Wood.
2. In Tiles. 5. In Metal.
3. In Vitrified Materials.

E. Enamels.
1. On Metals. 2. On China. 3. On Glass.

F. Materials and Processes applicable to the Fine Arts generally, including Fine Art Printing, Printing in Colour, etc. etc.
1. Encaustic Painting and Fresco.
2. Ornamental Printing, Chromo-typography, Gold-Illuminated Typography, Typography combined or uncombined with Embossing.
3. Lithography, Black, Chromo-lithography, Gold-Illuminated Lithography, Lithography combined or uncombined with Embossing.
4. Zincography or other modes of Printing.

G. Models.
1. In Architecture. 2. Topography. 3. Anatomy.

LYON PLAYFAIR.

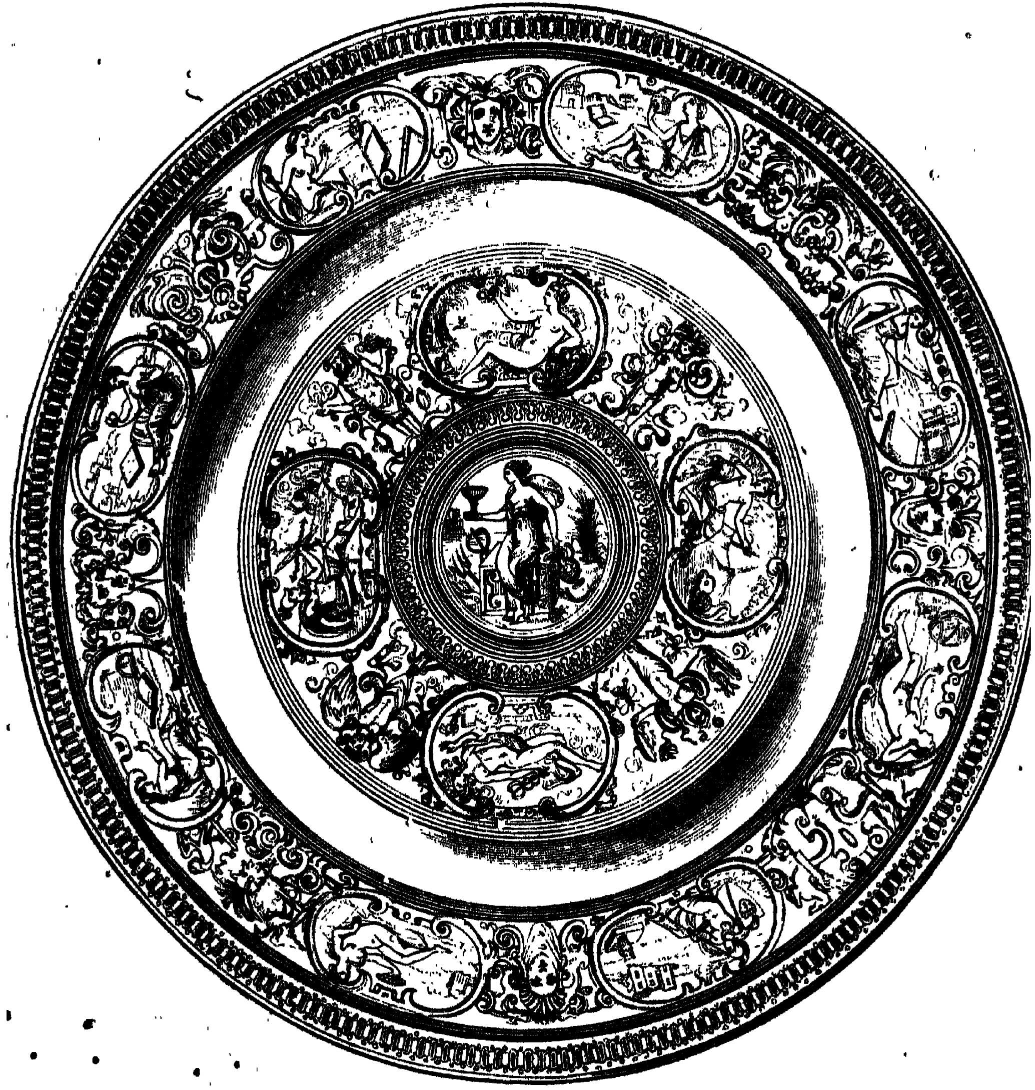
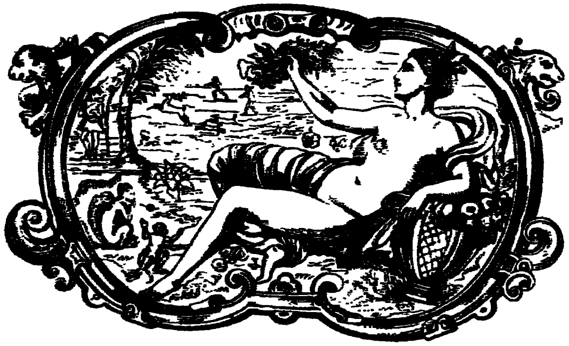
Descriptive and Illustrated Catalogue.

UNITED KINGDOM.

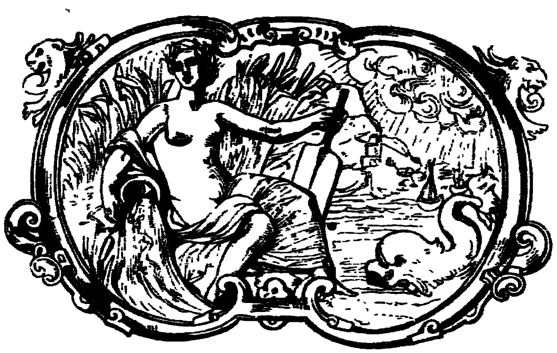
CLASSES I. to XXX.



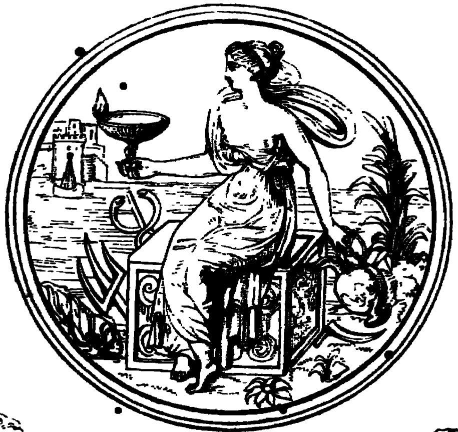
116. TABLE TOP, IN SILVER, AFTER THE ANTIQUE. PRODUCED BY THE ELECTROTYPE PROCESS. EXECUTED BY MESSRS. ELKINGTON. EXHIBITED BY HER MAJESTY THE QUEEN.



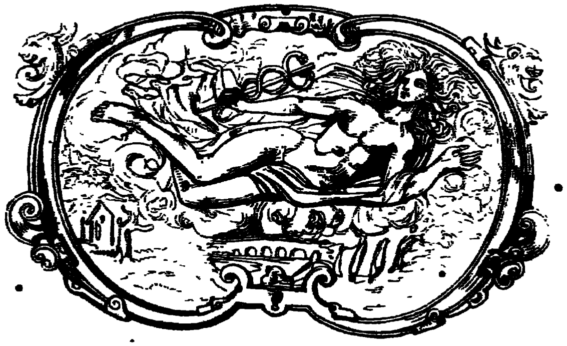
EARTH.



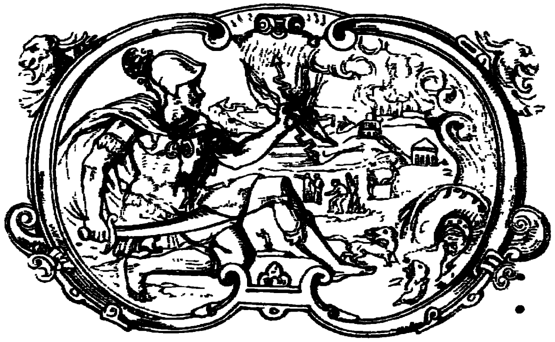
WATER.



TEMPERANCE.



AIR.



FIRE.

COMPARTMENTS OF ELECTRO-DEPOSIT TABLE-TOP.
EXHIBITED BY HER MAJESTY THE QUEEN. EXECUTED BY MESSRS. ELKINGTON AND CO.

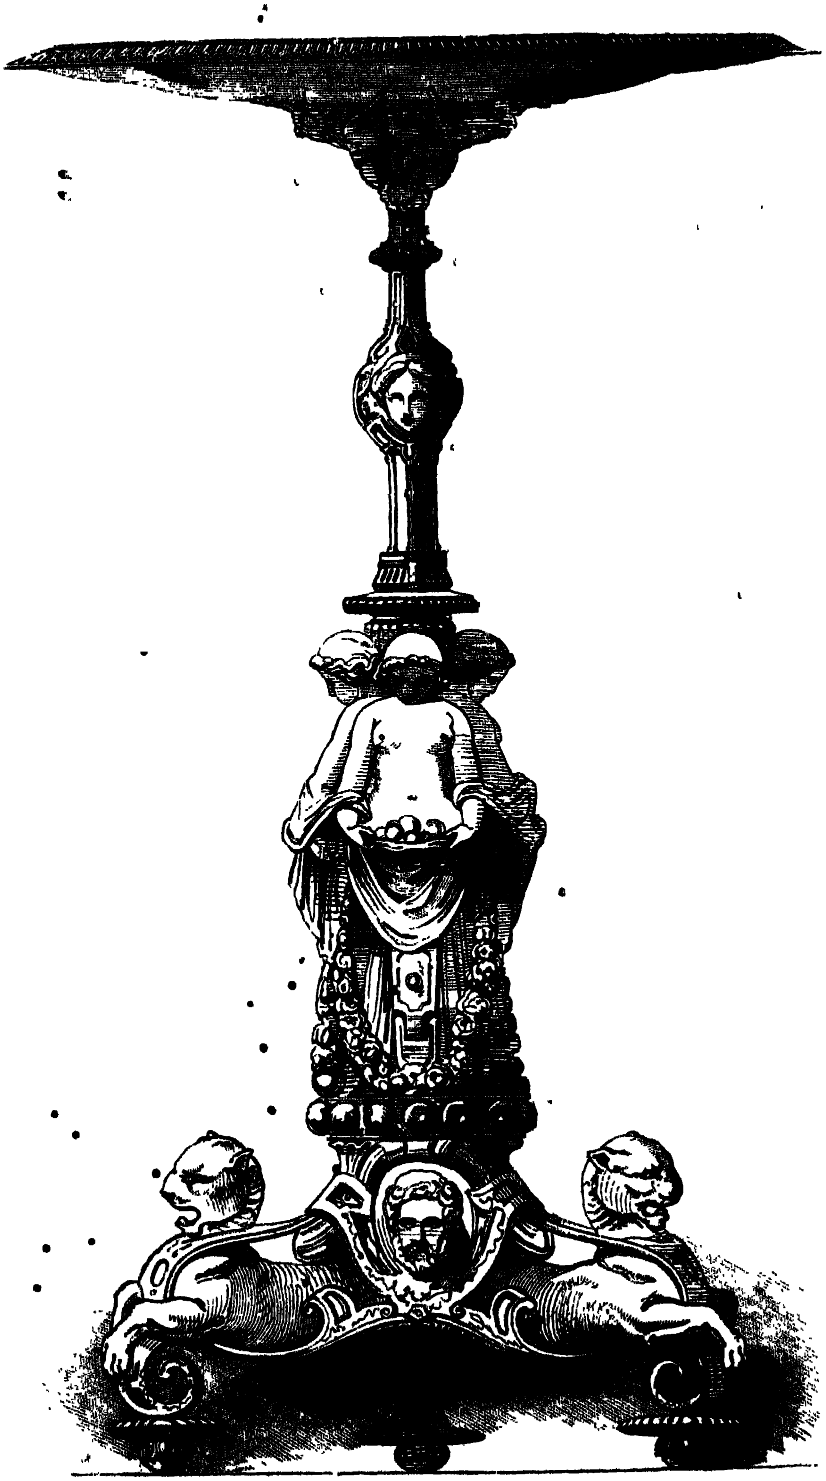


TABLE OF GOLD AND SILVER ELECTROPLATE, EXHIBITED BY HER MAJESTY.

ARTICLES EXHIBITED BY HER MAJESTY THE QUEEN, H. R. H. THE PRINCE ALBERT, AND H. R. H. THE PRINCE OF WALES, IN THE FOUR SECTIONS OF THE EXHIBITION.

HER MAJESTY THE QUEEN.

Main Avenue, East.

96 Portrait of Her Majesty on Sèvres china, size of life, half length, by A. Ducluzeau, after a portrait by F. Winterhalter. Painted in 1846.

97 Portrait of H.R.H. Prince Albert, on Sèvres china, size of life, half length, painted by A. Bezanget, after a portrait by F. Winterhalter. These portraits are exhibited jointly by Her Majesty and H.R.H. Prince Albert.

The Great Diamond of Runjeet Singh, called "Koh-i-Noor," or Mountain of Light.

Jewel-case in the cinque-cento style, designed by L. Gruner, Esq., and executed at the manufactory of Mr. Henry Elkington, at Birmingham. The material is bronze, gilt and silvered by electro-type process; upon this case are portraits, on china, of Her Majesty, H.R.H. Prince Albert, and H.R.H. the Prince of Wales, copied from miniatures by R. Thorburn, Esq., A.R.A. The small medallions, representing profiles of their Royal Highnesses the Princes and Princesses, were modelled from life by Leonard Wyon, Esq.

Class 23.—Central South Gallery.

1 Table of gold and silver electro-plate manufactured by Messrs. Elkington. The top of the table is an electrotype reproduction of a plate of fine workmanship, obtained and copied for Mr. H. Elkington under the direction of the Chevalier de Schlick. The eight subjects in bas-relief represent Minerva, Astrologia, Geometrica, Arithmetica, Musica, Rhetorica. The centre figure represents Temperance surrounded by the four elements. At the bottom of this plate is an inscription pointing to the artist. The table is designed by George Stanton, a young artist in the employ of Mr. H. Elkington, and a student in the Birmingham School of Design.

Class 30.—Fine Art Court.

353 A cradle, carved in Turkey boxwood by W. G. Rogers, and designed by his son, symbolising the union of the Royal House of England with that of Saxe Coburg and Gotha. One end exhibits in the centre the armorial bearings of Her Majesty the Queen, surrounded by masses of foliage, natural flowers and birds; on the rocker, beneath, is seen the head of "Nox," represented as a beautiful sleeping female, crowned with a garland of poppies, supported upon bats' wings, and surrounded by the seven planets.

The other end, or the back of the head of the cradle, is devoted to the arms of H.R.H. Prince Albert; the shield occupies the centre, and round it, among the arabesque foliage, the six crests of the Prince are scattered, with the motto "Treu und fest." Below, on the rocker, is discovered a head of "Somnus" with closed eyes, and over the chin a wimple, which, on each side, terminates in poppies.

In the interior of the head of the cradle, guardian angels are introduced; and above, the royal crown is found embedded in foliage. The friezes, forming the most important part of the sides of the body of the cradle, are composed of roses, poppies, conventional foliage, butterflies, and birds, while beneath them rise a variety of pinks, studied from nature. The edges and the insides of the rockers are enriched with the insignia of royalty and emblems of repose.

Class 24.—Central North Gallery, I. 27.

20 A pair of richly cut crystal glass candelabra, 8 feet high, carrying 15 lights each. The shaft composed of prisms upwards of 3 feet in length. Designed and manufactured by F. and C. Osler, of Birmingham, and 44 Oxford Street, London.

Class 19.—Central North Gallery, I. 30.

156 Axminster carpet, designed by L. Gruner, Esq., and manufactured at Glasgow, for Mr. Dowbiggen.

379 A Berlin wool carpet executed by one hundred and fifty ladies of Great Britain. The dimensions of this carpet are thirty feet in length, and twenty in breadth. The carpet has been produced in the following manner:—The pattern, originally designed and painted by the artist, has been subdivided into detached squares, which have been worked by different ladies, and on their completion the squares have been reunited, so as to complete the design. In the pattern, which consists partly of geometrical, and partly of floral forms, heraldic emblems are also introduced. The initials of the executants are ornamentally arranged, so as to form the external border. The whole design is connected by wreaths or bands of leaves and foliage, the centre group representing the store from whence they have been distributed.

The carpet has been produced under the management of a Committee. The design by Mr. J. W. Papworth; the patterns were painted and the work executed under the superintendence of Mr. W. B. Simpson.

Class 19.—South Gallery, P. 15 to 17.

Axminster carpet, designed by L. Gruner, Esq., and manufactured by Messrs. Blackmore Brothers, at Wilton, for Messrs. Watson, Bell, & Co.

On the "Bahamas" Counter.

Specimens of Abyssinian saddlery. Two mules' saddles complete. Two brass ornaments suspended on the necks of mules. One large coloured wicker basket. A small one. Two horse saddles, one with bridle, the other without; brass ornaments for the face and neck of the horse.

Two Abyssinian sheepskins, as worn by the natives over their clothes. Each of these is the skin of one sheep, the wool carefully dressed and extremely white. The baskets are good specimens of plaiting, and very flexible. The sandles of a very primitive construction, much resembling the old Morocco pattern, still retained in many districts in the South of Spain; and contrasting singularly with the elaborate and ornamental character of the head-gear, neck ornaments, &c., exhibited with them.

On the "South Australian" side.

Abyssinian shield of buffalo hide, with silver ornaments, and strip of lion's mane suspended from the boss. Diameter about 2 feet and a half.

Two Abyssinian silver coronets of superior design. One of these, to which a sort of metallic fringe is attached, displays a strong resemblance to the sort of diadem figured in Bruce's Travels. The forms of these coronets are by no means deficient in elegance and simplicity.

Two Abyssinian silver-gilt bracelets, apparently of some antiquity, and very much chased.

Two fine cotton cloths worn by Abyssinians of distinction.

Two Abyssinian double-edged sabres, the handles being made of rhinoceros' horn. The peculiar curve of the blade adapts the inside edge for the purpose of forage and grain-cutting. Two Abyssinian lances.

HIS ROYAL HIGHNESS PRINCE ALBERT.

South Transept.

15 Group in marble, "Theseus and Amazons," executed at Rome by Joseph Engel, Esq., from Hungary, pupil of the Royal Academy.

Class 3.

170 Three samples of grain grown on the royal farms at Windsor, consisting of wheat, oats, and beans, one bushel of each.

Class 4.

139 Wool, the production of Cashmere goats kept by His Royal Highness at Windsor. It is imported with a portion of strong white hairs, which it is requisite to have picked out by hand prior to attempting to manufacture the finer portions. These strong hairs are afterwards useful in making coarse woollen cloth.

Examples of these kinds of manufacture from this wool are exhibited in the Central Avenue.

Class 27.

140 A block of Parret coal from West Wemyss colliery, Kirkaldy, Fifeshire, partly polished.

141 Garden seat, designed by L. Gruner, Esq., and executed in Fifeshire by Thomas Williams Waun, of Parrot or cannel coal, from the estate of Rear-Admiral Wemyss.

Class 30.

350 Two slabs for tables, designed by L. Gruner, Esq., in the cinque-cento style, executed by Mr. Thomas Woodruff at Bakewell, in Derbyshire stones, in imitation of the Florentine mosaic.

351 Candelabrum in the cinque-cento style, designed by L. Gruner, Esq., modelled by Ant. Trentanove, and executed in scagliola in imitation of giallo antico, by L. Romoli.

HIS ROYAL HIGHNESS PRINCE ALBERT, ON BEHALF OF HIS ROYAL HIGHNESS THE PRINCE OF WALES.

98 Shield presented by His Majesty the King of Prussia to His Royal Highness the Prince of Wales, in commemoration of the baptism of the infant Prince, for whom His Majesty acted as sponsor.

The pictorial embellishments of the shield, the general plan for which was given by the king himself, were designed by Doctor Peter Von Cornelius, and the architectural ornaments by Counsellor Stüler. The execution of the remaining portions—the goldsmiths' work, enamel, &c., were performed by M. G. Hossauer; the modelling by M. A. Fischer; the chasing by M. H. Mertens; and the lapidary work by M. Calandrelli.

In the centre of the shield is a head of Our Saviour. The middle compartment, surrounded by a double line of ornamental work, is divided by a cross into four smaller compartments, which contain emblematic representations of the two Sacraments, Baptism and the Lord's Supper, with their Old Testament types, the opening of the fountain in the rock by Moses, and the fall of manna. At the extremities of the arms of the cross are represented the Evangelists, noting down what they have seen and heard in the Gospels, which are to communicate to all futurity the plan of man's salvation, and prove inexhaustible sources of divine revelation and doctrine.

On the extreme points of the arabesques that rise above the Evangelists, are represented the Christian virtues of Faith, Hope, and Charity, and of Christian Righteousness. Around the entire centre stand in a circle the twelve Apostles. Peter is seen under Faith represented in the arabesque; on the right and left of him are Philip and Andrew; under Hope is James; on either side are Bartholomew and Simon; John is placed beneath the figure of Charity; on either side are James the younger and Thomas; under Righteousness is Paul; on the right and left are Matthew and Judas Thaddeus, going forth into the world to teach and to baptize, and to propagate the kingdom of the Redeemer.

The relievo, which runs round the edge of the shield, represents the betrayal, the redeeming atonement of Christ, and his resurrection. Another portion represents Our Lord's triumphant entry into Jerusalem; a third portion the descent of the Holy Ghost, the preaching of the gospel, and the formation of the church. The fourth and principal compartment contains an allegorical representation of the birth of the Prince of Wales, and of the visit of the King of Prussia, accompanied by Baron Humboldt, General von Natzmer, and the Count von Stolberg, and welcomed by H.R.H. Prince Albert and the Duke of Wellington; a Knight of St. George being represented on the beach standing upon a dragon.

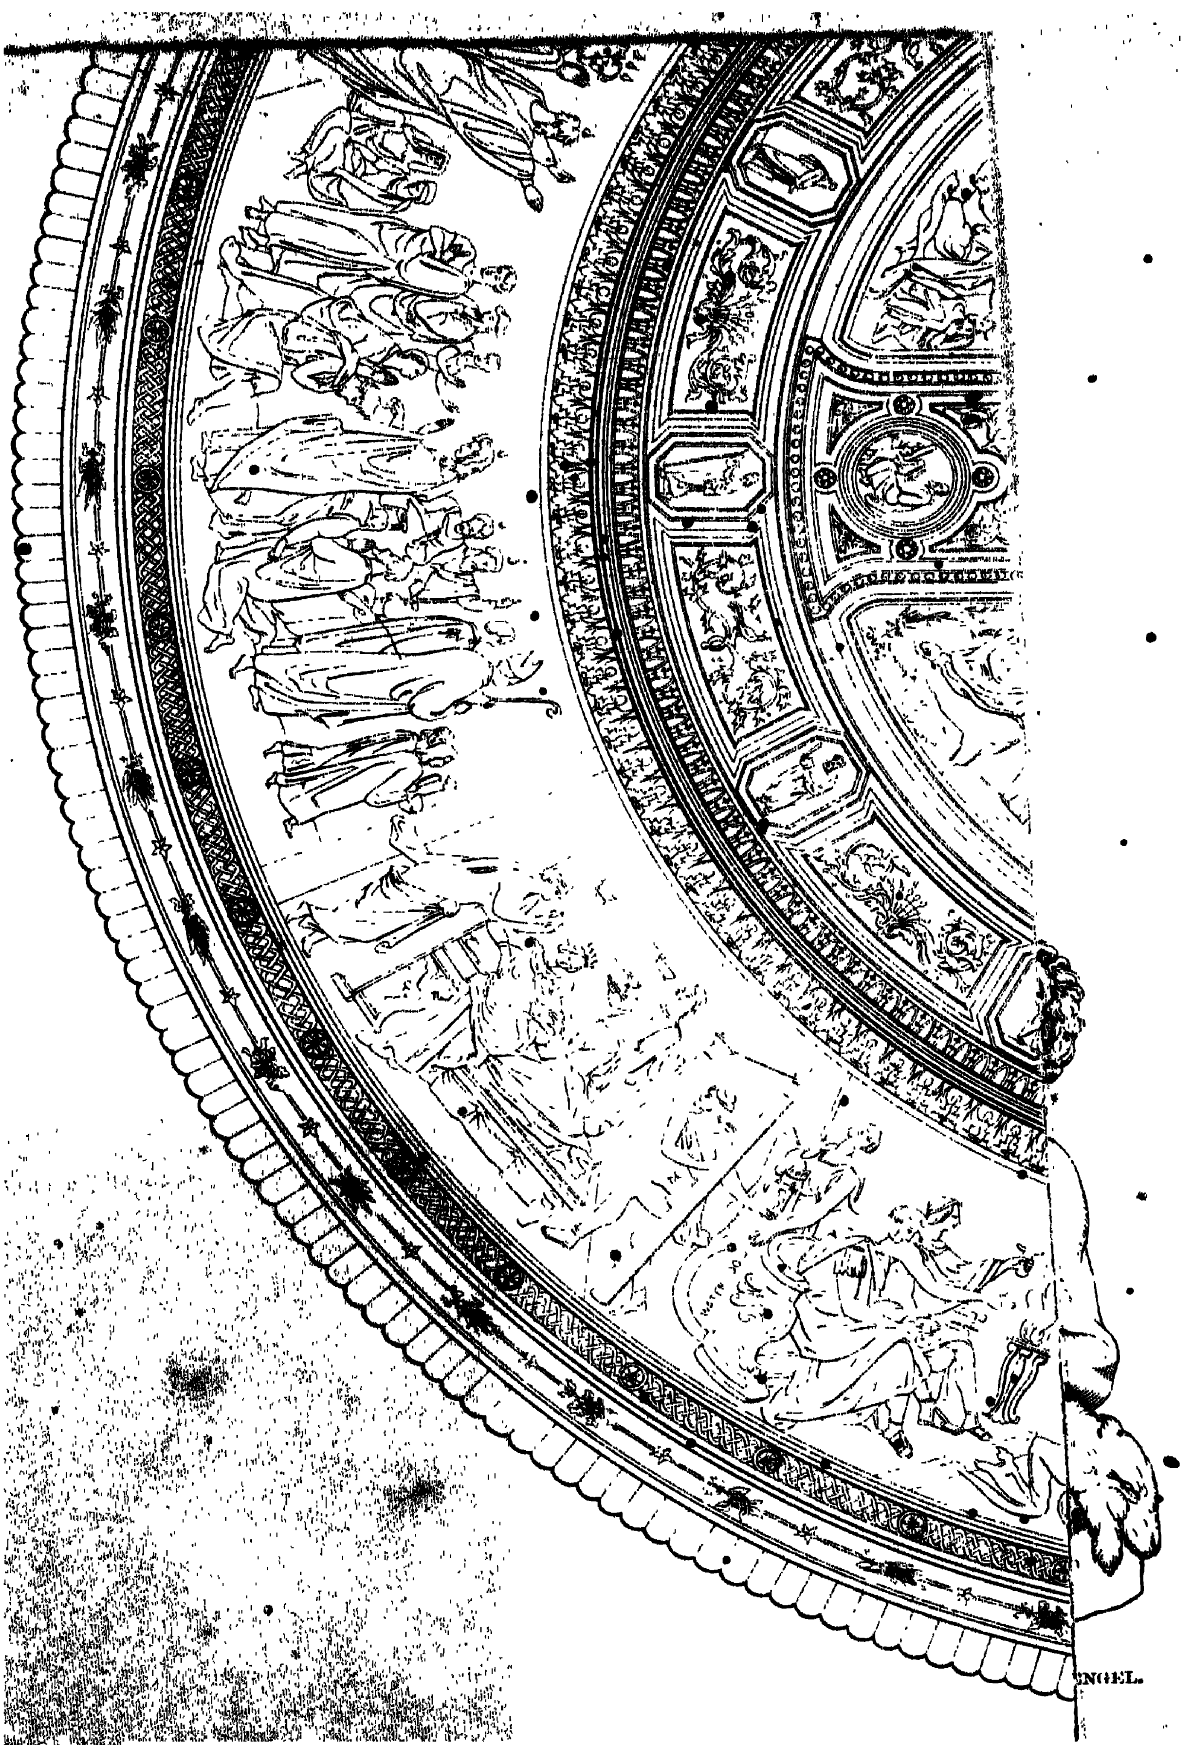
The shield has been denominated the Buckler of Faith. The inscription on the shield runs thus :—

FRIDERICUS GULIELMUS REX BORUSSORUM
ALBERTO EDUARDO, PRINCIPI WALLIÆ,
IN MEMORIAM DIEI BAPT. XXV JAN. A. MDCCCXLII.

Zollverein, Octagon Room, No. 836.

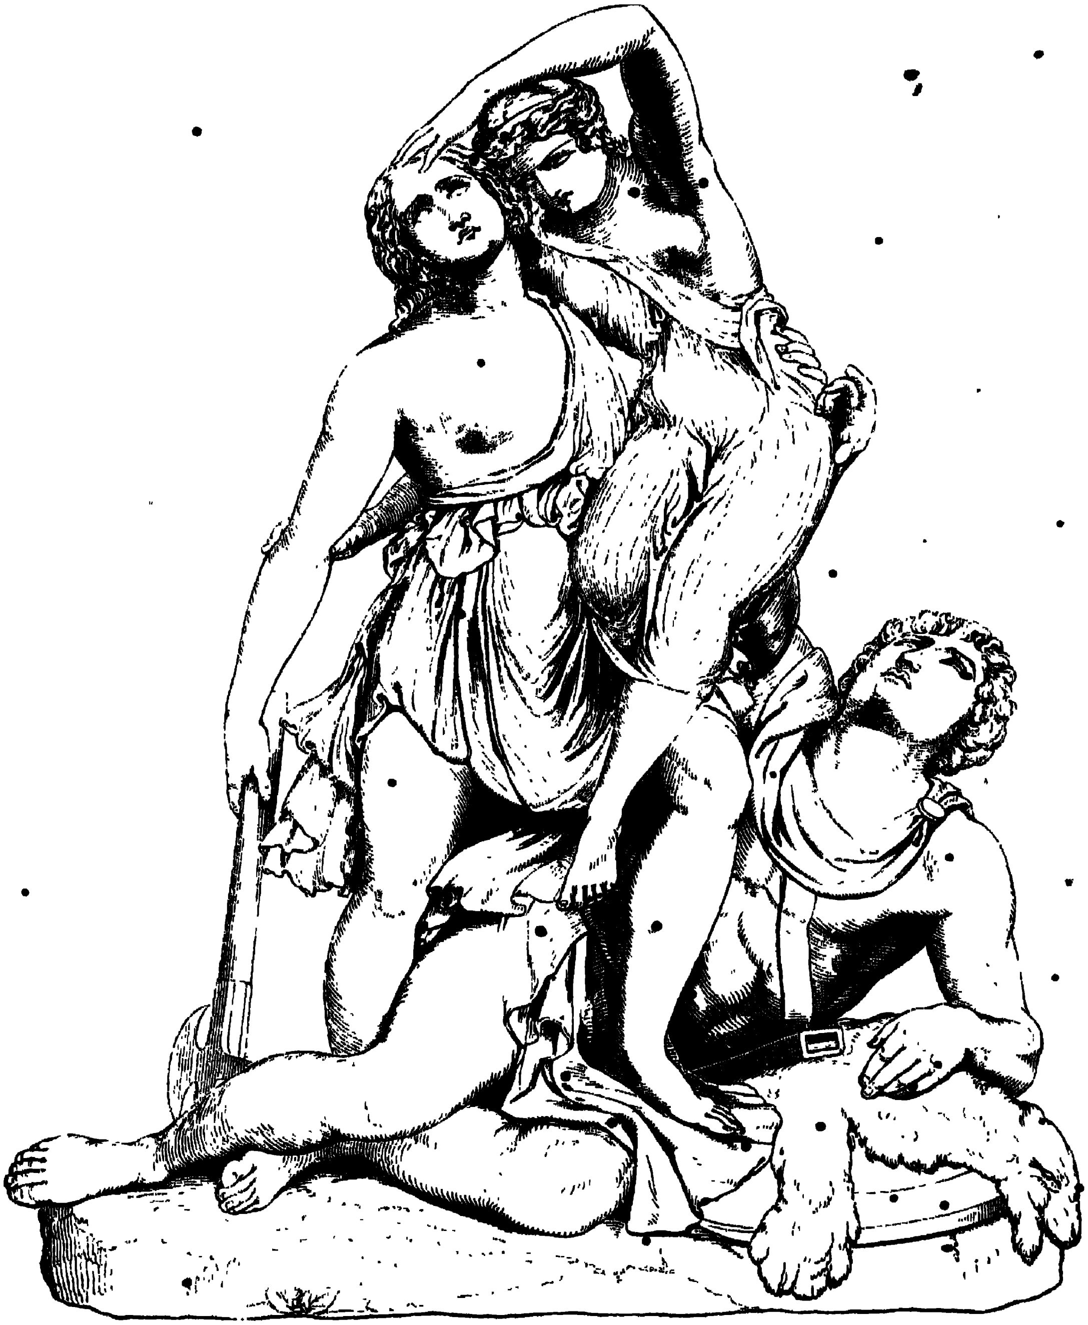
COUNT ERNEST OF COBURG-GOTHA.

Fruit stones of various sizes, carved with a penknife.

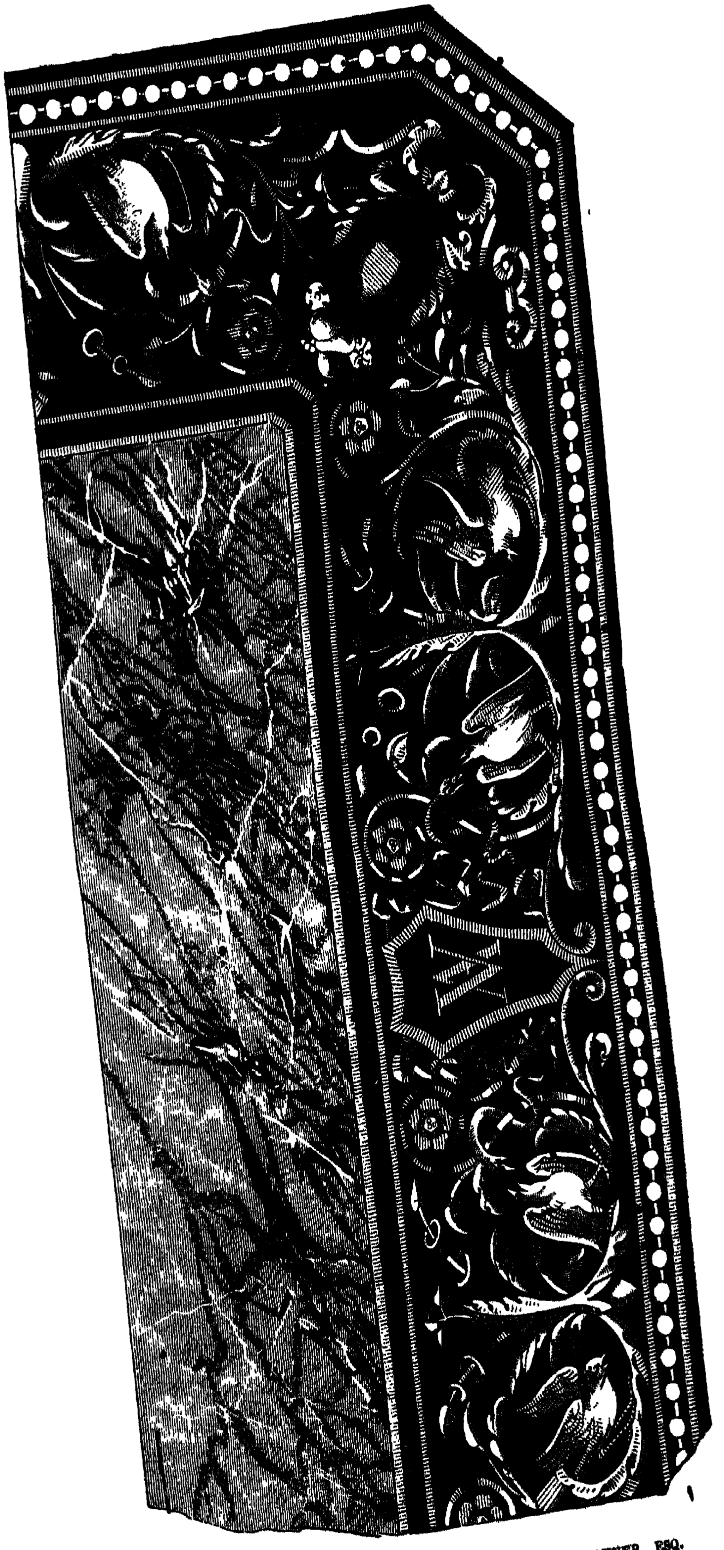


NGEL.

Shield [illegible] by His Majesty the KING of PRUSSIA to His
His Majesty acted as Sponsor. .... Designed by DOCTO



142. GROUP IN MARBLE—THESEUS AND THE AMAZONS. EXECUTED AT ROME BY JOSEPH ENGEL.
EXHIBITED BY H. R. H. PRINCE ALBERT.



PORTION OF A SLAB FOR A TABLE, DESIGNED BY L. GRUNER, ESQ.
EXECUTED IN DERBYSHIRE STONE BY MR. THOS. WOODRUFF.
EXHIBITED BY H. R. H. PRINCE ALBERT.

HIS ROYAL HIGHNESS PRINCE ALBERT.

Model houses for four families, at the Cavalry Barracks, Hyde Park, in connexion with the Exposition of the Works of Industry of All Nations, built by command of His Royal Highness, Prince Albert, President of the Society for Improving the Condition of the Labouring Cl

Ground Plan.

His Royal Highness has had this building raised on his own account, with a desire of conveying practical information calculated to promote the much-needed improvement of the dwellings of the working classes, and also of stimulating visitors to the Exhibition, whose position and circumstances may enable them to carry out similar undertakings, and thus, without pecuniary sacrifice, permanently to benefit those who are greatly dependent on others for their home and family comforts.

In its *general arrangement*, the building is adapted for the occupation of four families of the class of manufacturing and mechanical operatives, who usually reside in towns, or in their immediate vicinity; and as the value of land, which leads to the economising of space, by the placing of more than one family under the same roof, in some cases, renders the addition of a third, and even of a fourth story desirable, the plan has been suited to such an arrangement without any other alteration than the requisite increase in the strength of the walls.

The most prominent peculiarity of the design is that of the receding and protected central open staircase, with the connecting gallery on the first floor, formed of slate, and sheltered from the weather by the continuation of the main roof, which also screens the entrances to the dwellings.

The four tenements are arranged on precisely the same plan, two on each floor.

The entrance is through a small *lobby*, lighted from the upper part of the door.

The *living room* has a superficial area of about 150 feet, with a closet on one side of the fireplace, to which warm air may be introduced from the back of the range; over the fireplace is an iron rod for hanging pictures; and on the opposite side of the room a shelf is carried above the doors, with a rail fixed between them.

The scullery is fitted up with a sink, beneath which is a coal-bin of slate; a plate-rack at one end, drained by a slate slab into the sink, covers the entrance to the dust-shaft, which is enclosed by a balanced self-acting iron door. The dust-shaft leads into a closed depository under the stairs, and has a ventilating flue, carried up above the roof. The meat safe is ventilated through the hollow brickwork, and shelves are fixed over the doors. A dresser-flap may be fixed against the partition.

The *sleeping apartments*, being three in number, provide for that separation which, with a family, is so essential to morality and decency. Each has its distinct access, and a window into the open air; two have fireplaces.

The children's bed-rooms contain 50 feet superficial each, and, opening out of the living room, an opportunity is afforded for the exercise of parental watchfulness, without the unwholesome crowding of the living room, by its use as a sleeping apartment.

The parents' bed-room, with a superficial area of about 100 feet, is entered through the scullery—an arrangement in many respects preferable to a direct approach from the living room, particularly in case of sickness. The recess in this room provides a closet for linen; and a shelf is carried over the door, with a rail fixed beneath it—a provision which is made in each of the other bedrooms.

The water-closet is fitted up with a Staffordshire glazed basin, which is complete without any wood fittings, and supplied with water from a slate cistern in common of 160 gallons, placed on the roof over the party and staircase walls. The same pipes which carry away the rain-water from the roof serve for the use of the closets.

Constructive arrangement.—The peculiarities of the building in this respect are, the exclusive use of hollow bricks for the walls and partitions (excepting the foundations, which are of ordinary brickwork), and the entire absence of timber in the floors and roof, which are formed with flat arches of hollow brickwork, rising from 8 to 9 inches, set in cement, and tied in by wrought-iron rods connected with cast-iron springers, which rest on the external walls, and bind the whole structure together; the building is thus rendered fire-proof, and much less liable to decay than those of ordinary construction. The roof arching, which is levelled with concrete, and covered with patent metallic lava, secures the upper rooms from the liability to changes of temperature to which apartments next the roof are generally subject, and the transmission of sound, as well as the percolation of moisture, so common through ordinary floors, is effectually impeded by the hollow-brick arched floors.

The external and main internal walls are of patent bonded brickwork, which has the important advantages of securing dryness and warmth,* with economy of construction; another great benefit arising from the use of hollow bricks is, that where they are laid double, in parallel courses, without headers, as in the patent bonded brickwork, the internal face of the wall is sufficiently smooth to render plastering unnecessary. In the present instance, where plastering has been resorted to, it is confined to one side of a thin partition, or to partitions formed with bricks not intended for the situation in which they are used.

In regard to some other parts of the brickwork, it should also be observed, that owing to the erection of the building having been determined on late in the winter, many difficulties had to be contended with in obtaining a sufficient supply of hollow bricks; and from accidental circumstances, disappointments were experienced in reference to a considerable number, on which account the structure should be regarded rather as the pledge of future excellence in hollow-brick construction than as its full accomplishment.

The glazed surface of the bricks used in the two upper-floor living-rooms, and at the foot of the staircase, may be referred to as a specimen of what can be accomplished by the skilful adaptation of fitting materials, and as highly creditable to their maker. Specimens of glazed bricks of clay from the north of Devon are also exhibited.

The advantages afforded by the use of hollow bricks in securing an effective system of insensible *ventilation*, deserves particular notice. Fresh air is admitted from any suitable point of the exterior of the building to a chamber at the back of the living-room fireplace, where being warmed, it may be conducted to any convenient place of exit above the level at which the fresh air is admitted. Vitiated air may be conveyed either into the chimney flue or to any other suitable place of exit through the upper wall courses, perforated for this purpose, beneath the springing of the arch, or through the arch-bricks themselves. Suitable air-bricks and ventilators have been prepared with these express objects in view.

Internally French plaster has been used, as drying quicker, and having a harder surface than ordinary plaster. The floors, where not of Portland cement, are laid with Staffordshire tiles, excepting to the right-hand room first floor, which is of lava. The coping is in Portland cement. The external string courses and internal cornices are patent bonded bricks set in Portland cement, with the splayed side outwards.

The mode of fire-proof construction, and the general arrangement of the fittings, are such as have been used in the Model Houses built by the Society for Improving the Condition of the Labouring Classes, to which the architect of this building, HENRY ROBERTS, Esq., F.S.A., also acted as honorary architect.

In most parts of England, the cost of four houses, built on the plan of this model structure, with ordinary materials, and finished similar to the ground-floor apartments, may be stated at 440*l.* to 480*l.*, or from 110*l.* to 120*l.* for each tenement, contingent on the facilities for obtaining materials and the value of labour. Such dwellings, let at 3*s.* 6*d.* to 4*s.* a-week, would, after deducting ground-rent and taxes, afford a return of 7 per cent. on the amount of outlay. Where hollow bricks are obtainable at a fair price, their use ought to effect a reduction of about 25 per cent. on the cost of the brickwork, or equal on these four houses to about 40*l.*

---

* Those who are conversant with the evils resulting from the absorption of moisture by common bricks, and the consequent loss of temperature in rooms by evaporation, will duly appreciate these advantages.

OUTSIDE THE BUILDING.

MINING AND MINERAL PRODUCTS.

INTRODUCTION.

THE objects placed in this position are so in consequence either of their size, or of their peculiar fitness for such a site. On the southern side of the Western Entrance the objects are principally those which belong to Classes 1 and 27. Among these are fine specimens of the mineral fuel forming so valuable a feature in the geology of this country Several of the blocks of coal have been raised from deep pits by the ordinary lifting tackle, and present, from their size, a favourable idea of the mechanical facilities of extraction and means of transport possessed by the miners and railroads of England. The blocks of granite, of slate, of serpentine, of stone for grindstones, and of artificial cement, will likewise attract due notice. On the northern side of the West Entrance are large anchors, as those used in the Navy, a fine column of granite, specimens of colossal earthenware, life-boats, the atmospheric recorder, hothouses, &c. The space within the Building, occupied by any of these articles, would have been great, while their intrinsic attractiveness might scarcely have been adequate to it. In their present position they are also better placed for examination.—R. E.

WESTERN END.

1 **ORGAN, JOHN,** *Penzance, Cornwall*—Manufacturer.

Large block of serpentine from the Lizard, partly polished.

[The serpentine of Cornwall is a green mineral, passing into yellow and red, the colour being often veined, spotted, dotted, and clouded. It is soft in the quarry, but becomes hard on exposure, and cuts readily, but its fracture is irregular. It is soft to the touch, but not greasy like steatite or talc; is indented by a blow of a hammer; is infusible before the blowpipe; but parts with water by calcination, and hardens by exposure to heat. It is slightly acted on by acids.

As a rock, serpentine is often mixed with other minerals, so that different specimens do not yield the same result on analysis. It usually contains, when pure, silica 42 to 44, magnesia 36 to 38, water 12 to 13, and is therefore a silicate of magnesia. Its colour is due to oxide of chromium, but it contains often much iron, and is sometimes magnetic.

The serpentine of Cornwall is considered to exhibit four varieties, differing much in hardness—these are called precious, common, steatitic, and calcareous; but the best kinds for ornamental purposes on a large scale are those found at Kennack Cove, the Balk, and Cadgwith, where large blocks can be obtained. The block placed outside the Building near the south-western exit will show the magnitude and capability of such blocks.

A considerable quantity of the serpentine of the Lizard was formerly shipped to Bristol, for the manufacture of carbonate of magnesia.—D. T. A.]

---

2 **BOARD, —,** (Agent, **JAMES O'DONOHUE,** 5 *Quickset Row, New Road*).

Two figures in artificial stone.

3 **TEAGLE, R. & W.,** 42 *Hertford Street, Chelsea*—Inventors and Manufacturers.

A figure of Lazarus, in artificial stone; cast taken from a carved wood figure.

4 **RAYSDALE, W.**—Producer.

Blocks of gypsum used in the manufacture of plaster.

ROBINS, ASPDIN, & COX, *Northfleet, and Great Scotland Yard, Whitehall*—Manufacturers.

Slab of Portland cement. Iron testing-socket, for proving the strength of the cement. Bricks cemented together, equal to a pressure of three tons on the first brick. Beam of cement. Bricks, joined together with one portion of cement and four of sand. Step of Portland cement. Block of cement, which bore a pressure of upwards of 250 tons, tested by Bramah's hydraulic press. Similar block, one portion of cement, and four of sand, which bore a pressure of 120 tons. Block of Portland stone of like dimensions, which broke under pressure. Brick beam, one portion of cement and three of sand; sustaining a weight of 3½ tons. Bricks, joined together with one portion of cement, and three of sand, bearing a weight of one ton. Blocks of the hardest Yorkshire stone, joined by one portion of cement, and one of sand, sustaining a weight of three tons.

[Portland cement is formed by calcining together limestone and some argillaceous earth, the result being a mass which rapidly absorbs a certain quantity of water, and then becomes solid, as a hydrous silicate of lime. The advantages over natural hydraulic limes consist generally of greater hardness and durability, arising from the mixture of material being more perfectly under command.—D. T. A.]

6 **Morphet, Jonathan**, *Studfold, near Settle*—Producer.

Specimens of stone called blue flag, or Grauwacke. Obtained from Horton Wood quarries, which have been worked probably about 100 years. This stone is principally used for cisterns and partitions, and is useful for curriers' tables, tanks, &c.

The quarries are about six miles from the Settle Station of the North-Western Railway.

7 **Greaves, R.**, *Warwick*—Proprietor and Producer.

Blue lias limestone, with samples of the lime in the lump and ground.

Models in lias, Portland, and improved Roman cement.

Blocks of concrete, made in lias, Portland, and Roman cement, and ground-lias lime.

Brick-work cut from the Copenhagen tunnel in the Great Northern Railway, and set in lias lime. Ornaments cut and set in the same, to show the adhesiveness of the mortar.

Lias flag-stone, adopted for hall, church, and house-floors, being hard and dry.

Lithographic stones.

Floors in lias stone and lias cements.

[The beds of lias in many parts of England, consisting of carbonate of lime mixed with from 20 to 35 per cent. of alumina, are well adapted for the manufacture of hydraulic cements, and the nature of the clay greatly affects the value of the cement. Samples of the raw material, with various applications of it, are, therefore, of great practical importance. The lithographic stones from the lias are not unlike those from Germany, but they have hitherto been little used.—D. T. A.]

8 **Old Delabole Slate Company** (by **J. Carter**), *Camelford*—Proprietors.

Slate slab, as raised from the quarries at Delabole.

Slate cistern for holding water, liquid manure, oil, acids, &c., capable of containing 2,000 gallons. If used for water for domestic purposes, a self-supplying filter is attached, so that the water withdrawn at the tap passes through the filter

9 **Stirling, J.**, jun., *Belvidere Road, Lambeth*—Designer, Inventor, and Manufacturer.

Specimens of slate.—(See Class 1, No. 209.)

10 **White & Sons**, *Westminster*—Manufacturers.

Illustrations of the strength of cement.—(See Class 1, No. 130.)

11 **Seeley, John**, *Keppel Row, New Road*—Manufacturer.

Mercury, after Giov. da Bologna, in artificial stone.

Welsh Slate Company.

Barwis, W. H. B., *Secretary*, 1 *New Boswell Court*—Producer.

Rough block of slate from the quarry of the Welsh Slate Company, at Festiniog, Merionethshire.

Slabs of slate, sawn and planed.

Roofing and other slates.

The slates of Festiniog are of admirable quality, and obtained in slabs of very large dimensions, adapted to all the more important uses of the material. The quarries are extensive, and give employment to a large population.—D. T. A.]

13 **Sinclair**, *Forse, Thurso, Scotland*—Producer.

A cistern or bath of Forse-Rockhill flag. Samples of the stone, showing the natural surface, the half-rubbed, and the full-rubbed surface. Three portions of a passage of twenty-four feet long by six feet broad each, laid with the same pavement, showing the three different kinds of surface.

The principal uses of the article are laying footways, courts, railway stations, floors of manufactories and warehouses, kitchens, cellars, cottages, entrance halls, churches, &c. When used with iron girders, it renders mills, &c., fireproof, and is useful for farm buildings, and for cisterns, baths, manure tanks, troughs in chemical works, coping, for garden walls, &c. The pavement is found at the Forse-Rockhill quarries, four miles west from Thurso, Caithness, and it is there manufactured chiefly by machinery. It is said to be of a hard, close, strong, and uniform quality, and impervious to wet. It occurs in beds of various thickness, from one inch to three or four inches, and from one foot to eighty or a hundred feet superficial. The stone has been worked for more than twelve years, and is sent in large quantities to London, Glasgow, and other towns.

[The Caithness flags are well known and much used for various economic purposes, chiefly paving. They are quarried from the middle division of the old red sandstone (Devonian) series, as developed in the north of Scotland. The schists yielding them are often dark coloured and highly bituminous, slightly micaceous and calcareous, and often resembling rocks of much greater geological antiquity. Obscure vegetable impressions, and the remains of extinct fishes, are very frequently found in them, and these are often of considerable interest in the natural history of the ancient inhabitants of our globe.—D. T. A.]

14 **Freeman, W. & J.**, *Millbank Street, Westminster*—Producers.

An obelisk in granite. Sundry large slabs and blocks of stone.

16 **Struthers, William Samuel**, 7 *Holywell Street, Westminster*—Manufacturer.

Slate water filter, the water being filtered in its ascent.

[The filtration of water by ascension is a simple mechanical process, of considerable use in the arts, and capable of many modifications. The cistern, in such case, is furnished with two perforated shelves or false bottoms, between which the filtering medium is packed. At some distance above these is a third shelf, with a water-tight communication through the intervening chamber and the filter-bed, and opening into the bottom of the cistern. The foul water being let into the upper chamber, a cistern passes down into the bottom one by means of the tube, and is then forced up through the filter-beds by the presence of the water in the column. The pure water is thus delivered into the intervening space, whence it may be drawn off at convenience. Slate is an admirable material for cisterns of all kinds, from its great strength, perfect cleanliness, and complete impermeability to water.—D. T. A.]

17 **Royal Dublin Society**—Producers.

Specimens of Irish flagging.

18 **Sharp, Samuel**, *Commercial Road, Lambeth*, to **Alexander** *Wick, N. Britain*—Proprietor.

Rockhill paving stones, fron the original quarries, shipped from the port of Wic showing the different thicknesses as they naturally [illegible] in the quarries.

19 **Furse, Thomas Wm.**, 96 *High Street, Whitechapel*—Inventor and Manufacturer.

Specimens of waterproof artificial stone, as applicable for sewers and drains of large dimensions; for flooring churches, vestibules, public buildings, hospitals, and damp cellars. Drains for railways, &c. Drop-stone. Cistern of the same, containing bricks united with fusible mineral cement, to prevent the ascent of damp in foundations, &c. Ornamental brick of the same.

Sample of fusible mineral cement, which when gauged with 150 per cent. of dry sharp sand, unites bricks and stones so firmly that they cannot again be separated.

20 **CARNEGIE, W. F. L.,** *Kinblethmont, Arbroath, Scotland*—Proprietor.

Flagstones and freestones, known as Arbroath pavement, from Leysmill Quarries, dressed by Hunter's stone planing machine.—(See Class 1, No. 198.)

22 **HAYWOOD, JONAS,** *Ardsley, near Barnsley*—Producer.

Grindstones from the Ardsley Oaks Quarry, Barnsley, used principally in Lancashire and Yorkshire, for the grinding of machinery, files, edge tools, needles, &c., and for building purposes.

23 **DOVE, DUGALD,** *Nitshill, Hurlet, near Glasgow*—Producer.

Freestone block, from Nitshill quarry. Grindstone from the same quarry, three feet in diameter by six inches thick.

[The sandstones and greenstones of Nitshill are chiefly or entirely of the carboniferous period, and include several kinds of various degrees of excellence.—D. T. A.

24 **BEDFORD, BONSON, DRAKE, & Co.,** *Oaks Quarry, near Barnsley*—Producers.

Grindstones from the Oaks Quarry, near Barnsley, 9 feet 7 inches in diameter and 14½ inches thick, for grinding machinery; 4 feet in diameter and 6 inches thick, for grinding tools; 2 feet 6 inches in diameter and 9 inches thick, for grinding files.

25 **RAYNES, LUPTON, & Co.,** *Liverpool*—Producers.

Specimens of pure limestone, from Pentregwyddel quarries, near Abergele, Denbighshire; used in the rough state, in chemical manufactures, and as building cement (lime); and in the manufactured state, as a lithographic stone, &c.

Specimens of stone, from Graig-lwyd quarries (Penmaen-Mawr, Carnarvonshire), cut into paving, channel, and kerb-stones, and arranged in a frame as they would appear in a street pavement; and shown in a block, used as wheelers, or tram-road stones, channels, &c.

[The stone from Penmaen-Mawr, here exhibited, is an extremely hard compact rock of igneous origin, admirably adapted, from its toughness, for all kinds of paving purposes. It is much used in the neighbourhood of Liverpool, and is also exported largely.—D. T. A.]

26 **PENZANCE SERPENTINE COMPANY**—Producers.

A block of rough serpentine.

27 **TOWLER, EDWARD,** *Market Rasen*—Producer.

Stones adapted for paving, walling, road-making, and polishing, from Kirton Lindseys Tunnel Stone Works, containing 95 per cent. of carbonate of lime.

Blue lias and hydraulic cement.

28 **FRANKLIN, P. S.,** *Galway, Ireland*—Proprietor.

Block of stone, partly polished. Block of marble and paving-stones.

29 **BROWN, RUSBY, & BOOTH,** *Sheffield*—Producers and Manufacturers.

Flags and steps. Block of sandstone, weight four tons.

30 **LOCAL COMMITTEE,** *Falmouth and Penryn*—Producers.

Sundry paving-stones.

34 **OAKELEY, EDWARD,** *Coed Talon, near Mold, Flintshire, Wales*—Producer.

Steam-coal from Coed Talon and Leeswood collieries, near Mold, North Wales.

[This noble column of coal, said to weigh 16 tons, is from the main coal of the Flintshire coal-field, a seam nine feet thick, accompanied by five other beds of coal and four beds of ironstone. The quality of the coal is bituminous, and the proportion of ash less than 3 per cent. The Flintshire coal-field is a narrow strip, partly covered with new red sandstone, and extends 40 miles from north to south, with an ascertained breadth of from two to 12 miles, being cut off by a north and south fault. The mines supplying the specimen extend over 1,300 acres, and were opened about 30 years ago. About 2,000 tons of coal per week are raised from them.—D. T. A.]

35 **BUCKINGHAM, J.,** 13 *Judd Place East, New Road* (Agent to Messrs. MYERS & Co., *Bonville's Court Collieries*)—Producer and Importer.

Anthracite coal, from Tenby, South Wales. Specimens of patent artificial stone.

36 **ROUND, D. G.,** *Hange Colliery, Tipton, near Birmingham*—Producer and Proprietor.

Specimens of iron ore.

Specimen of coal from the thirty feet, or thick-coal seam of South Staffordshire, cut out of the solid coal. This specimen is of the largest dimensions that could be brought out of the mine up a seven-feet circular shaft. It measures eighteen feet in circumference, and weighs five tons.

The rope used in lifting it is also exhibited; it was manufactured by Mr. Wm. A. Chubb, of Woodpark, Devonport.

The chains used in sending the coal out of the mine are shown in connexion with the rope; the block was raised by means of the ordinary machinery employed in the colliery. The picks used in hewing the coal.

[The thick coal-seam of Staffordshire, of which a complete section is given by the exhibitors, and of which also a fine block weighing five tons is shown by Mr. Round, does not extend over a very large area, consisting, in fact, of the accidental junction of several seams with very thin and carbonaceous bands. The whole are necessarily worked together, and below them are no less than eight other seams (one of them 9 feet thick) worked near Wolverhampton. The district yields much ironstone, and the coal is being rapidly abstracted: it is used to an enormous extent for manufacturing purposes and iron-smelting in the neighbourhood of Birmingham.—D. T. A.]

37 **JAMES & AUBREY,** *Swansea*—Producers.

A large block of anthracite, or stone coal, from Cwmllynfell, in the Swansea valley.

[The great South-Welsh coal-field includes, at a moderate estimate, as much as 1,000 square miles of country, unequally divided between bituminous coal and anthracite, the dividing line being nearly coincident with the Neath Valley, and the anthracite portion extending to the west. The anthracite has only recently been introduced into use, but is now recognised as a very important material, the different kinds being of great value for special purposes, and yielding sometimes as much as 92 per cent. of carbon. The pure Welsh anthracite has been found to evaporate 10 lb. 8¾ oz. water, by one pound of coal, the best bituminous coal not evaporating more than 8 lbs. There is no reason to suppose any difference in geological age between the bituminous and anthracite coals.—D. T. A.]

38 **INCE HALL COAL & CANNEL COMPANY**, *Wigan*—Producer.

Blocks of Arley and Pemberton coal.

39 **CAMERON'S COALBROOK STEAM COAL and SWANSEA and LOUGHOR RAILWAY COMPANY**, 2 *Moorgate Street*—Producers.

Specimen of steam coal (of a quality intermediate between bituminous coal and anthracite), from the mines near Loughor, in the county of Glamorgan, South Wales, which have been worked about eight years. It is exported from the ports of Swansea and Llanelly in the Bristol Channel.

40 **HAINES, RICHARD, & SONS**, *Denbigh Hall, Tipton, Staffordshire*—Proprietors.

Large specimen of the Staffordshire thick, or ten-yard coal; height, 9 feet 6 inches; circumference, 21 feet 10 inches; weight, 13 tons. Brought 70 yards underground to the bottom of the shaft, and raised from a depth of 165 yards by the ordinary steam-engine, with no other apparatus than that regularly in use.

41 **BARROW, R.**, *Staveley Works, near Chesterfield, Derbyshire*—Producer.

Coal from the mines of Staveley, county of Derby, raised from a shaft 459 feet deep. The block is estimated to weigh 24 tons.—(See Class 1, No. 255.)

42 **JONES, SELLS, & Co.**, 55 *Bankside, Southwark*—Agents.

Anthracite coal, from Llanelly, South Wales.—(See Class 1, No. 258.)

43 **DAVIS, D.**, *Hirwain, near Merthyr Tydvil, Wales*-Proprietor.

The Blaengwawr steam coal, from Aberdare.

44 **NEATH ABBEY COAL COMPANY**, *Glamorganshire*—Proprietors.

Brynddwey (or Bryndorway) coal. Obtained under a mountain lying between the vales of Neath and Swansea, and about three miles from the sea. The coal known by the name of Graigola is from the same seam.

Anthracite coal—obtained from an eighteen-feet seam under the mountains, on the western side of the vale of Neath, and about twelve miles from the sea.

45 **PRICE, T. P. & D.**, *Tillery Colliery, near Newport, Monmouthshire*—Producers.

Steam coal, from Tillery, near Newport, Monmouthshire, the produce of a newly-opened colliery (in the South Wales coal basin), upon the steam-coal vein, "the Elled," a 5-feet vein; the "big coal," an 8-feet vein; and the "¾ coal," an 8-feet 7-inch vein; all of superior quality. The coal is obtainable in masses of 50 tons weight, and is adapted for steam purposes, and for exportation.

Analysis of Cwm Tillery Coal.

			Three-quarter Coal.	Elled Coal.	Big Vein Coal.
Coke .	Carbon .		630	660	680
	Ash	Silica .	32	36	30
		Alumina .	12	18	10
		Oxide of iron .	2	4	3
		Carb. of magnesia	4	2	4
		Carb. of lime .	0	0	1
Volatile matter			320	280	272
			1000	1000	1000

These seams of coal are said to be as rich, perhaps, as any in the South Wales basin. They lie upwards of 660 feet in depth, and are brought up by two steam-engines of 100-horse power each (high pressure). The colliery is a new one, and capable of producing 1000 tons per day.

47 **THE BRYMBO COMPANY**, *Wrexham, Wales*—Producers.

Block of coal, from Brymbo, near Wrexham, N. Wales.

48 **FITZWILLIAM, Earl CHARLES WILLIAM**, *Wentworth House, near Rotherham*—Producer.

Pillar, exhibiting a complete section of the Barnsley thick bed of coal, from the Elsicot colliery, and showing the different portions applicable for steam-engines and manufacturing purposes, and for domestic uses.

[The Barnsley coal is well illustrated in the Exhibition, as there will be found no less than three columns of it; two representing the whole thickness of what is called the thick bed, and the other from Silkstone, showing a beautiful variety of coal also found in the district. The situation of Barnsley, in the centre of the great coal-field of Yorkshire, and the abundance and quality of its coal, render it important among the inland towns producing mineral fuel. There are three principal varieties, viz., hard-stone coal, soft or tender coal, and cannel. The iridiscent or peacock coal may almost be regarded as a fourth. The coal is worked long-wall method.—D. T. A.]

49 **ABERCARN COAL COMPANY**—Producers.

Block of steam coal.

50 **GILMOUR, A., & Co.**, *Kilmarnock, Scotland*—Proprietors.

Coal from Hurlford and Skerrington Colliery, near Kilmarnock, exported from the port of Troon, and used principally for steam purposes. The colliery has been worked for upwards of forty years. Thickness of seam, 11 feet.

[The Kilmarnock coal-field, in Ayrshire, closely adjoins, and perhaps forms part of that worked a little to the south-west at Ayr. The coal is anthracitic for the most part, especially when near the trap dykes that intersect the district; but there are in the neighbourhood many seams of bituminous quality. As much as 150,000 tons of coal are exported annually from the Kilmarnock district.—D. T. A.]

2 **CRUTTWELL, ALLIES, & Co.**, *Cwm Celyn and Blaina Iron Works, Abergavenny*—Producers.

Fossil tree from the coal measures.

[This fossil is one of those called by palæontologists "Sigillaria," appearing like the trunk of a tree stamped with a pattern in the regular rows in direction of its length. It is probably the trunk of the same kind of tree as that of which roots are found in infinite abundance in the fire clays beneath coal-bands. It was very common during the coal period. The stems exhibit no wood structure internally, having been for the most part hollow or succulent, and easily crushed; but they had a central woody axis, and an outer coating of bark, which is often found turned into coal. Leaves were probably originally attached to the scars, and were connected through the bark with the central woody axis.]—D. T. A.]

53 **BAGNALL & GESSON**, *West Bromwich, near Birmingham*—Producers.

Column of South Staffordshire thick coal—showing the different working seams as they exist in vertical section.

[The South Staffordshire coal-field is remarkable, in a geological point of view, for the absence of the mountain limestone and millstone grit, and the immediate superposition of coal measures on the Silurian limestones; and it differs also from other formations of the same kind by having a great preponderance of shales, and few intervening beds of sandstone. It is quite clear that the circumstances of deposition must have been different, but the nature and extent of the difference it is not so easy to discover.

The coal measures in Staffordshire are thus the only representatives of the carboniferous system, and they are almost entirely made up of shales, alternating with seams of coal and ironstone.

The number of coal seams is only eleven, but the main bed in the middle of the deposit is upwards of 30 feet in thickness, and it comprises, in fact, several beds of coal, separated by partings of shale so thin that the whole is worked together. This *ten-yard coal* crops out near Bilston, and extends from thence entirely across the southern half of the coal-field, where it forms the principal object of mining operations.—D. T. A.]

54 **CHEESEWRING GRANITE COMPANY.**—Agent in London, **EDWARD TURNER**, *Belvidere Road, Lambeth*—Producer.

Granite column upon a pedestal about 30 feet high, from the Cheesewring granite quarries, on the Manor of Rollaton, near Liskeard, Cornwall, belonging to the Prince of Wales. The pedestal, cap and base to the column, worked at the Cheesewring granite wharf, Belvidere road, Lambeth, and the shaft at the quarries.

[The quarries which have produced this noble column have not hitherto been much worked, but are capable of great extension, the magnitude of the blocks obtainable from them being almost unlimited. The granite will be seen to be of excellent quality.—D. T. A.]

55 **RODGER**, Lieut. W., R.N., 9 *Shawfield Street, King's Road, Chelsea.*—Inventor and Patentee.

Large anchor, manufactured by Fox, Henderson, and Co.

57 **LONGRIDGE** & Co.—Manufacturers.

Large anchor.

58 **BROWN**, Sir S. **LENNOX**, & Co.—Manufacturers.

Large anchor.

59 **BATEMAN**, —, Inventor.

Two life-boats.

60 **YOUNG**, C. & Co., *Edinburgh*—Inventors and Manufacturers.

Simultaneously-acting level-crossing gates for railways.

61 **ENCH**, —, Producer.

Two greenhouses on a new construction. The chief of novelty are—1st. That by the peculiar conuction of the lights, and the selection made in the materials to be used, putty and all other adhesive composts are entirely avoided. 2nd. That the glass can be put in or removed with such facility, that the bars and frame can be painted, the glass cleaned, and the whole effectually repaired at an immense saving upon the old system. 3rd. That it will not require such frequent repairs as ordinary greenhouses. 4th. That in the event of a fracture, it will not be absolutely necessary to wait for the assistance of a glazier to repair the same; the simplicity of the contrivance enabling any one to become his own glazier. 5th. That leakage—a universal complaint in the old system—is here guarded against by a peculiar grooved bar, which likewise assists to carry off evaporation, and renders ventilation more complete. 6th. That the glass being moveable, persons can erect greenhouses upon the property of others, and remove the same securely at the expiration of lease or rental terms.

62 **KENT**, A., *Chichester*—Inventor.

New mode of glazing greenhouses.

63 **PHILLIPS, CHARLES**, *Weston-super-Mare*—Manufacturer.

Flower, rhubarb, seakale, layer, and salad pots, of superior clay, for forcing, protecting, and strengthening the plants.

Flower guards and seed basins. Garden tiles. Strawberry tiles. Water tables. Striking pans. Cress tiles.

64 **DOULTON** & Co., *Lambeth*—Manufacturers.

Large pipe in stone ware, and other articles.

65 **SINGER** & Co., *Vauxhall Pottery*—Manufacturers.

A still, and other articles in stone ware.

66 **FERGUSON, MILLER**, & Co., *Heathfield, near Glasgow*—Manufacturers.

Pipes and other large stone ware.

67 **GREEN**, S. & Co.—Manufacturers.

Large stone ware, adapted for chemical manufactures, household and other purposes.

[Salt-glazed stoneware—of which there are many fine specimens exhibited by the above and other persons—differs from porcelain both in the quality of the clay of which it is constructed, and in the mode of glazing.

The clay is obtained from Cornwall, Devonshire, and Dorsetshire, and consist largely of silica, the proportion of alumina being rather small, and the quantity of iron and lime inconsiderable. If either of these latter substances is present in too large a proportion, it acts as a flux, and the material cannot withstand the intense heat of the furnace. If also any impurities exist that are destroyed during firing, a hole would be the result, which would completely destroy the value of the object if required for chemical use.

The glazing of these vessels is effected by throwing into the vessels a quantity of very coarse salt shortly after the last charge has been added to the furnace-pipe; the salt is at once converted into vapour, and a perfect coating of glass is formed on every part of the vessels exposed, the soda of the salt uniting with the silica of the clay, while the liberated chlorine takes up the iron from the clay and escapes. Acids have no effect upon vessels thus prepared.—D. T. A.]

68 **GRANGEMOUTH COAL COMPANY**, *Grangemouth, Sunderland*—Manufacturers.

Sundry objects in stone ware, and fire clay; consisting of chimney cans, &c.

69 **GARNKIRK COMPANY** (**SPROT**, M. & T.)

Sundry articles in stone ware.

70 **RAMSAY**, G. H., *Derwent Haugh, Newcastle*—Inventor.

Fire-clay goods.

71 **FRANCIS** & **SONS**, *Nine Elms*—Manufacturers.

Drain pipes manufactured by machinery.

75 **HOSKEN, RICHARD**, *Penryn, Cornwall*—Manufacturer.

Granite obelisk and base (two pieces), being together 20 feet high, weighing about 15 tons. Exhibited to show the quality of the Cornish granite. Taken from the quarries at Carnseu, near Penryn. Of this material a great quantity was used in the construction of new London bridge.

[The granite best known as *Cornish*, is that obtained from near Penryn, which has been long and extensively used for various public works in England. It is obtained from various localities, and several qualities are employed, the finer kinds being very good. The whole quantity shipped at Penryn varies exceedingly in different years, amounting sometimes to nearly 20,000 tons, but is generally far less, often not a fourth part. The approximate value may be stated at about 1*s*. 9*d*. per cube foot before export, and the weight is usually taken at 14 cubic feet to the ton.—D. T. A.]

76 At some distance from the western extremity of the building is a colossal equestrian statue of Richard Cœur de Lion, by the Baron **MAROCHETTI**.

The paving in the South Enclosure is laid down by three exhibitors, Mr. **SINCLAIR**, Caithness; Messrs. **BROWN, RUSBY**, and Co. Yorkshire; and Mr. **FRANKLIN**, Ireland.

EASTERN END.

100 **KULLGRIN**, *Sweden*.

Monument of granite in form of a cross, cut out of a single block, remarkably fine grained.

---

101 **STANDISH & NOBLE**, *Bagshot*—Importers and Producers.

Cupressus funebris, or weeping cypress, 30 feet in height, from the green-tea country, Wheychow (Hwuychow), in the north of China, where it is used for ornamental planting, and in burial grounds, whence it takes its name. Live plants were first imported into this country in the spring of 1849.

Pieces of polished wood from the same tree.

102 ——, *France*.

Life-boat, as at present in use in the French navy.

---

103 **LEGLER**, —, *Paris*.

Ornamental fountain in cast-iron bronze, with figures, statuettes, &c.

---

104 ——, *India*.

Tent, the material manufactured at the Jubulpore School of Industry, in India, by Thugs.

The pavement at the eastern entrance is laid by the **SEYSSEL ASPHALTE COMPANY**, in their prepared asphalte.

The pavement at the South, or Transept Entrance, consists of slate slabs from Festiniog, North Wales.

SECT. 1.

CLASS 1.

MINING AND MINERAL PRODUCTS.

INTRODUCTION.

THE intention in the collection of the objects in the four Classes of the first section—Raw Materials and Produce—has been to give a practical illustration of those substances in the mineral, animal, and vegetable kingdoms, which human industry is constantly occupied in converting into the varied forms of manufactured articles, or which are themselves, as in the case of fuel, the indispensable sources of manufacturing power. If, therefore, it is desired to obtain a philosophical view of this Exhibition and its multifarious contents, it will be found useful to commence the study by the examination of those materials, which, in other departments, have been caused to assume forms so diversified. From the raw mineral it is thus possible to proceed through the various stages of its manufacture, until it is finally seen embodying the conceptions of the mechanic, the architect, or the artist. Many of the objects comprehended under these four Classes have little or no external beauty, and present, consequently, no appreciable value to the uninstructed. But if it be considered that, in the preparation of these materials for use, and in their application to the purposes of life, consists the daily toil of multitudes of the human family, then the Classes of raw materials appear to take on a new and interesting aspect.

The present Class is divisible into the following sub-classes:—A. Mining and quarrying operations. B. Geological maps, plans, and sections. C. Ores and metallurgical operations. D. Non-metallic mineral products. It comprises all that relates to the procuring of metal yielding mineral substances, to their mutual geological relations, and to the operations necessary for subduing them to the requirements of the manufacturer. It also includes the extraction of minerals used as fuel, of marine minerals used in construction, of minerals used in manufactures, for ornament and for agriculture. Specimens illustrative of each of these subjects are to be found in this Class; and if it be studied attentively it will be discovered that objects representative of all that properly belongs to the Class are contained in this collection.

This Class is partly contained within Avenue S. of the Building, and extends from the western entrance to the Sculpture Room. If the study of it be commenced at the Sculpture Room and proceeded with to the western extremity of the Avenue, it will be found that the metalliferous minerals and the objects illustrative of metallurgical processes generally, are first encountered, and subsequently the non-metallic minerals, fuels, stones, and geological specimens. The arrangement of the objects in the Catalogue is, however, in the opposite direction. Upon the walls of this avenue are arranged maps, plans, and geological sections, in addition to specimens of decoration belonging to Class 27, which have a certain relation with the present Class.

Among the groups of objects which present themselves most prominently on entering the avenue at the Sculpture Room are large specimens of lead ore and of lead in various stages of preparation. Specimens of silver extracted from lead by the crystallizing process of silver and gold, of iron, copper, tin, zinc, and other metals, are arranged in order along the Avenue. To these succeed mining apparatus of various kinds, and models illustrative of mining processes. Mineral fuels, containing every variety of coal, with specimens of cannel coal in manufactured state, cokes, peat, and artificial fuels come next. Slates, with illustrations of their economical application, building stones, china-clays, cements, and artificial stones follow these, and are succeeded by geological specimens, gems, &c., up to the western termination of the avenue.

This Class is also illustrated by several large objects placed outside the Building; among these are artificial ts applied to various purposes, specimens of slate, flagstones, blocks of anthracite and other coal, pillars exhibiting sections of beds of that substance, and columns formed of single blocks of granite. Several of these specimens are remarkable for their size, and furnish good illustrations of the mechanical facilities of extraction and of transport possessed by this country.

The whole of this Class may be considered well illustrative of the mineral wealth of Britain. If our supplies of the more precious metals are limited, the resources of power and wealth are given to this country in the exhaustless stores of minerals yielding the viler metals, and a fossil fuel with which it has been endowed. The ore, the fuel for its reduction, and the material for the necessary processes, are all to be found in abundance, and generally in direct geological proximity to each other. The possession of these materials, added to the development of the means of their employment, and of the applications of their products, lie at the foundation of the present commercial and productive greatness of Great Britain.—R. E.

Fossil fishes from the old red sandstone (*Cephalaspis*)

[The fossil fishes found in certain parts of the old red sandstone formation are of considerable value in marking the age of the deposit where the mineral character of the beds is very different from that ordinarily recognised. The specimen above referred to will be found to show very perfectly the general form of an animal so widely and clearly distinct from that of common fishes, that some doubt may be felt as to the identification. The relation has, however, been made out very satisfactorily, and several allied genera have been found in rocks of similar ancient date.—D. T. A.]

---

2 **POWELL, WILLIAM JOHN**, *Tisbury, near Hindon, Wilts*—Proprietor.

Geological specimens:—A species of coral, from the sand of the upper oolite formation at Tisbury, found in a vein extending northward, and now converted into flint and chert. The hardest flints from this locality were originally manufactured into gun flints.

[The town of Tisbury is on the Portland stone; but the lower beds of the Purbeck series, as well as the uppermost oolites, are quarried in the neighbourhood. A continuous bed of flint, about two inches thick, is seen in one of the quarries, and from this band are obtained beautiful specimens of coral in chalcedony. Some of the oolite of the neighbourhood is very fine-grained.—D. T. A.]

---

3 **CARTER, J.**, *Delabole, near Camelford, Cornwall*—Proprietor.

Two specimens of rock crystal, taken from the slate quarries at Delabole, near Cornwall; used for jewellery.

[The use of rock crystal in the arts is still very considerable, as it is employed extensively in making spectacle glasses and for other optical purposes. It was formerly used for cups and various ornaments, and many finely cut specimens are exhibited from India, China, &c. The finest and largest crystals are from Madagascar, Switzerland, and North America.—D. T. A.]

---

4 **BONITTO, J. NELSON; BALLERAS, G. E.**, *of London*, Exhibitors; and **PARIS, E.**—Producer.

Specimens of emerald in the matrix from the mine of Muso, New Granada.

[Emeralds of large size and perfect clearness are extremely rare, and of great value, but found with flaws they are not so uncommon. They occur chiefly near granite in Siberia, Sweden, and New Granada, and in Africa, between Egypt and Ethiopia. The lightly coloured are called beryl, and are found in the East Indies and Brazil. Emeralds have also been obtained from various parts of France, Ireland, Saxony, the Tyrol, and Connecticut, in the United States. Emerald is harder than quartz; its specific gravity is 2·73 (heavier than beryl), and it is generally found crystallized in a prismatic form. It is a silicate of alumina and a rare earth called *glucina*, coloured by chrome.—D. T. A.]

---

5 & 138 **LENTAIGNE, JOHN**, *Tallaght House, Dublin*—Proprietor.

A specimen of limestone inclosing granite.

Specimens of iron pyrites, from the great sulphur lode, Ballygahan mine, Wicklow; exported to Liverpool, &c. Sulphuret of copper, from same place. Sulphuret of lead, or galena; white carbonate of lead; sulphate of barytes, with crystals of phosphate of lead; all from Glenmolure mine, county Wicklow.

Native gold, and imitation of a large piece (found some years ago), from the gold mines, county Wicklow.

Silver (the property of Mr. Donegan, Dublin), from the Irish Mining Company's lead mines.

Specimens of stratified breccia, composed of angular fragments of granite embedded in calx or impure limestone, and of granite, from Crumlin quarry, near Tallaght, county Dublin.

Sulphuret of lead, from Killing mine, county Dublin; from Clontarf mine; from Lyrus, county Kildare; and other counties. Black oxide and other copper ores from Ballystein, county Limerick. Sulphurets of lead and copper, in fluate of lime, from Inveran, near Galway. Peacock copper ore, from Killarney mines. Oxide of manganese, from Glandore, county Cork. Bog iron ore, from Howth, county Dublin. Crystals of quartz, weighing 84 lbs., from Donegal.

[The iron pyrites of Wicklow is used in the chemical works of St. Helen's, and other places near Liverpool, for various processes where sulphur is required. It contains, when pure, iron 46·67, sulphur 53·33.

This material is associated with the copper ores of Wicklow, and occurs in a vein traversing the copper lodes in a north-eastern and south-western direction. It is found at the surface, and is raised in large quantities, down to the depth of 50 feet, the lode varying in width from 4 to 36 feet.

The native gold of Wicklow is remarkable for the comparatively large quantities in which it has been found. Some of the lumps weighed from 18 to 22 ounces, and 945 ounces were collected during some operations carried on by Government some years ago. The gold is associated with iron and quartz, in a bed of detritus varying from 20 to 50 feet deep.

Considerable quantities of silver, as well as gold, have been found in Ireland at various periods in the history of the country.—D. T. A.]

Block of carboniferous limestone containing shells of *Productus*.

---

7 **BREADALBANE, Marquis of**, *Taymouth, Aberfeldy, Perth*—Producer.

Specimens from the silver-lead mine of Corriebuie, on the south side of Loch Tay, Perthshire.

Specimens from the lead mines of Tyndrum, Perthshire.

Chromate of iron, from the mine of Corriecharmaig, in Glenlochy, Perthshire.

Hæmatitic iron, from Glenquaich, Perthshire.

Rutile, or oxide of titanium, from the north side of Loch Tay, Perthshire.

Brown quartz, from Ben-Lawers, north side of Loch Tay, Perthshire.

Granite and porphyry, from the forest of Glenorchy, in Argyllshire.

Granite, from the quarries of Barrs and Inverliver, on Loch Etive, Argyllshire.

[The mineral produce of Perthshire, illustrated above, is obtained from systems of veins, some of which, running N.W. and S.W., contain copper ores of various kinds, with some ores of iron; and others, running N.N.E. and S.S.W., contain chiefly lead ore. The veinstone is generally qua and the ores include several interesting minerals.—D. T. A.]

LEESON, DR. H. B., *Greenwich*—Inventor.

Models, crystalline minerals, and engravings; illustrative of the exhibitor's system of crystallography.

The following are the principles upon which these models have been constructed:—

When the atoms of any description of matter have arranged themselves through the intervention of certain natural forces, in a form characterized by the evident order and angular disposition of its bounding surfaces, such solid form is termed a crystal.

Every crystal may be referred to one or other of three classes or systems.

These three classes are dependent on the relative direction of three lines not all in the same plane, indicative of the direction from a common centre of origin of the natural forces by which the crystal has been formed; such three lines are termed the gubernatorial axes.

The three classes are as follows:—

Class 1. Rectangular. All the axes at right angles to each other.

Class II. Oblique rectangular. One axis oblique to the other two, which are rectangular.

Class III. Oblique. All three axes making equal oblique angles with each other.

All the axes are of equal length, and in the second and third class the prevailing angle of obliquity is nearly (if not invariably) 101° 49′ 9·4″, and its supplement 78° 10′ 50·6″.

It is a very simple but important law, easily demonstrated, and greatly facilitating crystallographic investigations, that any plane of any crystal whatever must belong to one or other of the three following forms, which may be designated and defined as follows:—

Trisecant. Cutting all three gubernatorial axes.

Duosecant. Cutting only two axes, and therefore parallel to the third.

Ultimate. Cutting only one, and therefore parallel to the other two.

A set of fundamental forms, similarly constituted, belongs to each of the three classes.

This circumstance, viz., the existence of such a set of forms, characterizes a class or system.

Each fundamental form is produced by six similar and equal four-sided pyramids, one being placed at each end of every gubernatorial axis, so that the diameters of the base of the pyramid coincide with or bisect the other two gubernatorial axes.

When the diameters of the base of the pyramid coincide with or are parallel to the gubernatorial axes, the form produced is trisecant. When, on the contrary, the diameters of the base of the pyramid bisect or are parallel to the line of bisection of the gubernatorial axes, the form produced is duosecant.

The series of fundamental forms is produced by a successive diminution in the height of the pyramid, according to a regular law. The diameter of the base of the pyramid in the trisecant series, and the sides of the base in the duosecant series, being a multiple of its height by some integer. When the diameter of the base becomes infinitely extended, or the height of the pyramid becomes 0, we arrive at the ultimate form, which is a cube in the rectangular class, a right rhombic prism in the oblique rectangular class, and a rhombohedron in the oblique class.

The most frequent, if not the only series, is that in which the ratio of height in the pyramid to the diameters or sides of its base is as 1 to some power of 2, those actually observed being 2^1, 2^2, 2^3, 2^4, and 2^6. In this series we may pass from the trisecant to the duosecant, and from the duosecant to the trisecant forms, by a continual replacement of edges by planes. Thus commencing with the octohedron, and replacing its edges by planes, we pass to the dodecahedron, or first duosecant form. Thence to the trapezohedron, or second trisecant form. Thence to the pyramidal hexahedron, or second duosecant form. Thence to a flatter trapezohedron, and so on, till we arrive at the ultimate form, or cube, when, by replacement of its edges, we may return to the dodecahedron, or first duosecant form.

A new set of forms is produced by rotating, inverting, or altering the position of the pyramids 45°, so as to make trisecant pyramids duosecant, and duosecant pyramids trisecant; and next, by combination of two equal and similar fundamental forms, a set of forms having an eight-sided pyramid is produced at each end of the gubernatorial axes: thus, two octohedrons joined together produce the triakis octohedron; two trapezohedrons joined together produce the hexakisoctohedron, and so on.

It appears as if these forms, like macled crystals, arise from a simultaneous development of two crystals in opposite directions, and then what would be re-entering angles are filled up, so that only the edges of the two crystals remain. Thus each eight-sided pyramid consists of planes joining the four lateral edges of one pyramid with those of the four lateral edges of another equal and similar pyramid. Lastly, from the forms thus described an infinite variety of others are obtained, first by the unequal development of particular planes, and next by composition of two or more forms.

In natural crystals, it is frequently observed that certain planes are extended more than others; indeed, it will be found that unequal development is the rule, and perfect forms are the exception. In the case of the diamond, which very commonly crystallizes in the regular octohedral form, the octohedron is constantly unequally developed, giving rise to the various forms exhibited in the drawing.

When unequal development does not occasion the loss of any plane, the form is termed simply imperfect; but when, as in the passage of the octohedron into the tetrahedron, or into the rhombohedron, certain planes are obliterated, the form is termed defective.

The law of unequal development shows that whatever forms can be produced thereby from the series of forms already described, they may possibly have existence without any dimorphism in the substance examined. Proceeding on this basis, the exhibitor has discovered that all the unequal-axed crystals are merely unequal developments which have concealed the true character of the crystals, but which have been abundantly and conclusively explained by the small remnants of planes to which little attention has been heretofore directed, but which become of great significancy in relation to the law in question.

9 **MITCHELL, Rev. WALTER,** *St. Bartholomew's Hospital*—Designer and Inventor.

Series of models in paper, representing all the primary and secondary forms of crystals, and the most important combinations of those forms.

10 **DYER, WILLIAM,** *Little Hampton, near Arundel*—Proprietor and Inventor.

Sussex coast agates, found on the sea-beach; many containing specimens of petrified sponges, sea anemones (*Choanites Königii*), and other zoophytes. Specimens fashioned and polished for ornaments.

[The agates on the Sussex coast are, to a great extent, if not entirely, chalk flints in a peculiar state; and they frequently exhibit very beautiful indications of organic structure. The definition of agate generally in mineralogy has reference to an apparently banded structure, or concentric arrangement of silicious matter, often showing different tints of colour. When of considerable size, the central part is generally clear. The essential material is, in all cases, silica, and the colour is, no doubt, due to metallic oxides, chiefly of iron and manganese.—D. T. A.]

11 **SLATER & WRIGHT,** *Whitby*—Manufacturers.

Specimens of rough jet, and articles manufactured from jet for ornamental purposes.

[Jet is a variety of coal occurring abundantly in certain localities, but not associated with true coal. At Whitby it is found in the lias beds of that district, and has long been known and worked. It is also common in France (Languedoc), the Alps, Spain (the Asturias), and Gallicia, and in the United States at Massachusetts. Very large quantities are used for ornamental purposes, and for rosaries, crosses, &c., in Roman Catholic countries. The true jet is much lighter and pleasanter to wear than the numerous imitations that abound everywhere.—D. T. A.]

12 WEBB, —, *Calcot Farm, Reading*—Producer.

Portion of a fossil silicified tree from the sand. The horn of an ox dug up from the peat.

---

13 ELLIS, R., *Harrowgate*—Producer.

Collection of the different mineral waters of Harrowgate, and their analyses.

---

14 TENNANT, JAMES, 149 *Strand*—Mineralogist.

Four cases of minerals and fossils for educational, scientific, and ornamental purposes.

A magnificent and gigantic crystal of emerald, the property of His Grace the Duke of Devonshire, by whose permission it is exhibited.

[This collection includes, among other objects, a series of crystals of gems of very great interest, illustrating the mode in which such objects are found and may be distinguished. It also exhibits a series of fossils useful in identifying rocks.—D. T. A.]

---

15 NELIS, JOHN, *Omagh, County Tyrone, Ireland*—Proprietor.

Pearls, with specimens of the shells in which they are formed; found in the deepest parts of the river Strule (fresh water), at the town of Omagh, county Tyrone.

[The shell-fish from which these specimens of native pearl are derived is the *Unio margaritifera*, and the pearls are second only in quality to those obtained from the true pearl-oyster, *Meleagrina margaritifera*. Pearl consists of concentric layers of membrane and carbonate of lime, and is partially soluble in acid.—E. F.]

---

16 COWIE, A., & RAE, W., *Ellon, Scotland*—Proprietors.

Pearls from the river Ythan, Aberdeenshire.

17 HORNE, —, *Camberwell*—Producer.

Petrified eggs and nest from Goree Island, west coast of North Africa, lat. 63° 13′.

18 MAYO, WILLIAM, 17 *Silver Street, Wood Street, Cheapside*—Inventor.

Glass pipes for the conveyance of aqueous or aeriform fluids. The novelty consists in the invention of a perfect joint. A metallic flange is firmly attached to the ends of the pipes without the use of any cement; the flanges are abutted, and secured together by screw couplings. By means of these joints, glass pipes can be laid down by any ordinary workman; they can be altered, extended, or removed at pleasure, the same joints being available for any length of time.

The glass pipes and joints exhibited are manufactured by Swinburne and Co., South Shields; the patentees, Mayo and Warmington.

18A LOWRY, J. W.—Producer.

Diagrams of fossils.

19 COOK, A.—Proprietor.

A large crystal of black quartz. (BATTEN, A., Agent.)

20 MACDONALD, Major C.—Proprietor.

A large series of turquoises in the matrix, in unpolished fragments, and manufactured into various ornaments.

[Turquoise is a well-marked mineral of a peculiar blue colour—opaque, or only slightly translucent at the edge; it is hard, and takes a good polish, infusible, and unaffected by acids. It is a hydrous phosphate of alumina, with a little oxide of copper as the colouring matter. It occurs chiefly in rounded lumps in Persia and Arabia. Large lumps are rarely pure, and the price is about that of the opal. False turquoises are common, and are manufactured of the teeth of animals coloured by phosphate of iron. They are much less hard than the true stone.—D. T. A.]

---

21 OLDFIELD, Rev. —, *Dublin*—Proprietor.

A mass of crystalline quartz adapted for various useful and ornamental purposes.

---

22 TOLAN, W.—Producer.

A collection of polished agates from the Isle of Wight.

[These Isle of Wight agates resemble those found on the Sussex coast, and exhibited by Mr. Dyer (10). The finest agates are from Oberstein (near a village of that name in the palatinate of Bavaria, situated on the river of Nahe, which enters the Rhine at Bingen), and from India. Very beautiful specimens of the latter are exhibited by the East India Company.—D. T. A.]

---

23 HIGHLEY, SAMUEL, jun., 32 *Fleet Street*—Collector and Preparer.

Sulphur Minerals.

1. Native sulphur in rhombic crystals, from Sicily.
2. Native massive sulphur.
3. Native earthy sulphur.
4. Iron pyrites or sulphuret of iron, from Cornwall, &c.
5. White iron pyrites, from Littmitz, near Carlsbad.
6. Radiated pyrites, from the chalk of Surrey and Isle of Wight.
7. Cockscomb pyrites, from Derbyshire.
8. Copper pyrites in crystals, from the Banat, &c.
9. Copper pyrites massive, from Staffordshire, &c.

Crude Sulphur of Commerce.

10. Crude Sicilian sulphur.
11. Crude drop sulphur.

Refined Sulphur.

12. Lump sulphur.
13. Roll sulphur.
14. Sublimed sulphur.
15. Sulphur vivum.
16 and 17. Sulphur precipitation, pure and (17) adulterated.

Crystallized Sulphur.

18. Crystals of sulphur from its solution in bi-sulphide of carbon.
19. Crystals from solutions of sulphur in camphine, made at temperatures varying from 77° cent. = 170·6° Faht. to 138° cent. = 280·4° Faht.
20. Crystals of sulphur deposited from sulpho-pentachloride of phosphorus.
21. Crystals obtained by the fusion of sulphur.

[Sulphur occurs native, in rhombic crystals; also massive with earthy and bituminous impurities, and occasionally with arsenic and selenium. It is generally found in volcanic districts and near hot springs in formations of various geological date. It occurs abundantly with iron and copper (iron and copper pyrites), and also with the common ores of lead, &c. It is used in chemical manufactures and in medicine; also for matches and gunpowder; and in preparing vermilion, sulphuric acid, vulcanised caoutchouc, &c. About 80,000 tons of sulphur are annually furnished from Sicily.—D. T. A.]

---

24 THISTLETHWAYTE, HENRY F., *The Vine House, Sevenoaks, Kent*—Producer.

A collection of gems and precious stones, chiefly illustrative of such as are used for personal ornament. The principal part of this collection was formed by Mr. Hertz, with a view to show the great variety of shades of colour in each species of stone, and to prove the connection of some classes; such as the corundum, where the tints of the ruby, sapphire, and topaz, are distinctly seen in the same stone. In the class of zircons and jargoons, the same connection of colours is exhibited. The specimens of diamond are interesting in point of crystallization as well as colour. The collection of pearls exhibit many varieties of colour both in the margarita and conch-shell specimens.

[The colours of certain minerals are extremely useful to the mineralogist in the determination of species, and are presented in great varieties in distinct series, but sometimes in very unconnected order. The most striking examples of series are found amongst gems, and are well illustrated in the collection described above, which is worthy of very careful observation and study.

The gems which best exhibit series of colours are diamond, corundum (oriental ruby and sapphire), topaz, emerald, garnet, and tourmaline. The zircons and jargoons are also remarkable, and highly interesting.

In most cases, minerals that are nearly allied, and are homomorphic, present similar series of colour; but in other cases, as in the diamond, the usual crystalline forms exhibit a more or less complex series in themselves. The principal colours of the gems are white, as opal, which is milk white; grey; black; blue, as some sapphires, which are Prussian blue, or the variety corundum, called ceylonite, which is indigo blue; green, as emerald; yellow, as topaz; red, as some zircons, garnets, ruby, &c.; and brown, as zircons.

The varieties of colour in pearls, extend from white and lead grey, through yellowish and pink, to black; the latter being, however, remarkable and rare exceptions, and the bluish or lead grey, being less valuable than more distinct tints. Some pearls exhibit much play of colour.—D. T. A.]

25 JAMIESON, GEORGE, 107 *Union Street, Aberdeen*—Proprietor.

Cairngorm stones from Cairngorm, Aberdeenshire, in the natural state, and cut into gems for jewellery.

Aberdeen and Peterhead granite, cut and mounted in brooches and other fancy articles, as buttons, studs, desk seals, pen-holders, &c.

A ram's head mounted in silver, as a snuff-box.

Scotch pearls found in the rivers Don, Ythan, and Ugie, Aberdeenshire. The shell from which the pearls are obtained.

[The Cairngorm mountain, one of those forming the granite nucleus of the Grampians, and rising to the height of 4,080 feet, is well known, and has been long celebrated for the fine quartz crystals of white, pink, dark brown, and black colours which take their name from it, and are found either in the cavities in the rock or the debris of rivers. Of these crystals, the deep-yellow varieties, when well cut and set, are sold as topazes, and sometimes called Scotch topaz, while the darker varieties are called smoke topaz.—D. T. A.]

26 CASSELS, ALEXANDER, *Edinburgh*—Proprietor.

Two curling stones used in Scotland in the national game of curling, made of the rock of Ailsa Craig, in the Firth of Clyde.

A specimen of the rock in the rough state.

The game of curling is practised upon ice during the winter. The Royal Caledonian Curling Club, of which His Royal Highness Prince Albert is patron, is composed of above 10,000 members.

[Ailsa Craig consists of a single rock of grayish compact felspar, with small grains of quartz, and very minute particles of hornblende. The height is stated to be 1100 feet, its length 3300, and its breadth 2200. On the east it rises by steps, but from the south, round by the west to the north, it is more perpendicular, and divided into columns. It rises abruptly from deep water, about 10 miles west of the coast of Ayrshire, and 15 miles south of the Isle of Arran.—D. T. A.]

27 KAY, J., *Hayhill, Ochiltree*—Manufacturer.

Curling stone, made of greenstone trap.

28 MAJENDIE, ASHHURST—Producer.

White topaz from Van Diemen's Land. Rough and cut.

28 A WATKINS, Rev. C. F., Vicar of Brixworth, *Northamptonshire*—Producer.

Silicious fossils from the chalk beds of South Wilts in quartz agates, calcedony, &c.

A collection of chalk flints, chiefly formed in some organic nucleus.

[The very beautiful series of specimens here exhibited admirably illustrates a variety of forms of organic bodies, which have been perpetuated by chalk flints, and which can have been only retained by a very rapid conversion of the original into silex. The bodies were in most cases either soft or readily decomposed, but are now surrounded by, as well as converted into, flint, the structure of which, under the microscope, often betrays the most minute details of the animal substance. Collections such as that here exhibited are of great value to the naturalist, and are calculated to be of general use for purposes of instruction in an important department of geology.—D. T. A.]

29 HOWARD, THOMAS, C.E., *Bristol*—Producer.

Collection of the sands, clays, building stones, marbles, coals, metals, and other minerals, belonging to the Bristol basin; a district bounded on the north by Thornbury and Tortworth, on the east by Chipping Sodbury, Bath, and Wells, on the south by the Mendip Hills, and on the west by the Bristol Channel; including a geological range from the Silurian rocks up to the Oolites, with some alluvial and diluvial deposits.

Geological map of England, showing the extent and position of the Bristol basin, relatively to the rest of the country.

Part of the Ordnance Survey of Great Britain, coloured geologically, showing the details of the Bristol district. Sections from north to south, and from west to east.

List of specimens of building stones, marbles, &c., in six-inch cubes:—

Oolite.

Upper oolites, from the neighbourhood of Bath.

Inferior oolite, from Dundry Hill, near Bristol.

Lias.

Blue lias (hydraulic lime when burnt), from Keynsham, near Bristol.

White lias, from Radstock and Poulton, Somerset.

"Landscape" lias, from Cotham, Bristol.

New Red Sandstone and Calcareo-Magnesian Conglomerates.

New red sandstone, found at Bristol.

Coarse sandstone, from Easton, Bristol.

Indurated red sandy marl, from Chew Magna, Somerset.

Fine-grained yellow conglomerate, found near Harley Place, Clifton.

Fine-grained crystalline calcareous conglomerate, found near Durdham Down.

Indurated red sandstone with calc spar.

Re-cemented magnesian conglomerate, from Clevedon, Somerset.

Conglomerate with quartz, limestone, &c., from Sea Mills, below Bristol.

Conglomerates from Clifton, Bristol; and from the tunnel of the Bristol Waterworks, Harptree, Somerset.

Silicious conglomerate with jaspery iron-stone, from Brandon Hill, Bristol.

Conglomerate, from the Mendip Hills.

Gypsum (sulphate of lime), from Windford, Somerset.

Coal Measures.

Pennant sandstones, from the middle part of the coal series.

Fine silicious grit (millstone grit, or miner's "farewell rock"), from Bristol.

Carboniferous or Mountain Limestone.

Series of limestones and marbles from the defile of the river Avon, Clifton, Bristol.

Old Red Sandstone, Silurian, &c.

Old red sandstone, from the banks of the Avon, below Bristol.

Grey sandstone, from Tortworth, Gloucestershire.

Red silicious conglomerate, from Markham Bottom, near Bristol.

Transition limestone and sandstone, from Tortworth and Charfield, Gloucestershire.

[The neighbourhood of Bristol is remarkable for the great variety of mineral produce which it yields, and the extended series of rocks observable within a moderate distance.

It presents in the oolites, a series of building stones, universally known throughout England; in the lias, a number of useful materials used for lime, cement, and other purposes; in the new red sandstone, mineral soils rich in agricultural produce; in the coal measures, a very large store of mineral fuel; and in the carboniferous limestone, admirable and beautiful building material, adapted for almost every variety of circumstance. The Mendip Hills supply an important series of metalliferous ores; and, in addition to these sources of interest, many illustrations of the extinct natural history of our country are obtained from almost all the formations down to those of the latest date.—D. T. A.]

Amygdaloidal trap rock, from Damory, Gloucestershire.

Samples of the brick and pottery clays, with specimens of the manufacture.

Samples of sands, used for commercial purposes, and of the deposit from which the "Bath scouring brick" is made. This brick is manufactured by Messrs. Ford & Son, Bridgewater.

Samples of ochre, reddle (oxide of iron), fullers' earth, &c.

Samples of strontian, massive and fibrous; gypsum, massive and fibrous; barytes (sulphate of); lime, white and the brown, or hydraulic.

Iron ores—hæmatite, compact, silicious, stalactitic, reniform, &c.

Ores of zinc: Blende (sulphuret); calamine (carbonate).

Ores of lead: Galena (sulphuret); white lead ore (carbonate). Phosphate and muriate of lead.

Manganese ore (black).

Antimony ore (sulphuret).

Specimens of quartz crystals (Bristol diamonds); crystals of calc spar; geodes (locally, potato-stones), containing various crystals, agates, &c.

Series of the various seams of coal, worked in the Bristol coal basin, showing the cleavage, fracture, &c.

Maps and sections illustrative of the position and localities of the specimens are exhibited with them.

[This series of rocks, illustrating the economic geology of the Bristol district, is of considerable interest, as showing a large succession of beds, and the result, in some measure, of their close association at the surface. Of the substances used economically, the sands for Bath bricks, ochres, quartz crystals, and geodes, are worthy of notice. Of the ochres, the red and yellow are found in considerable quantities and of very good quality. They are friable, and stain the finger. The red is of deep colour, between crimson and purple, and of strong body; the yellow of fine gold colour. They are dry and mix well. The Bristol diamonds are clear quartz crystals, chiefly found near Clifton.—D. T. A.]

30 **FAHIE, JAMES K.**, *Tipperary, Ireland*—Producer.

Copper ore, found on Lord Stanley's property, near Tipperary, and from Hollyford.

Lead ore, found at Oola, near Tipperary.

Minerals from several parts of the country.

Anthracite coal, from Killanaule.

Building limestone, found near Tipperary.

Black and white marble, found at Mitchelstown, county Cork. Red and grey marble, found at Cloyne.

Hydraulic limestone, found near Tipperary; a natural cement, produced in powder and biscuit.

Artificial cement, prepared from chalk, alluvium, and pit clay; and stucco, for interior work; prepared from gypsum found in a limestone quarry near Tipperary.

White clay, in its rough state, found near Caher, and prepared in biscuit and small bricks, used for stone ware and pottery. Black clay, in its rough state, found at Killanaule. Black fullers' clay, found near Caher, in a stratum over white clay.

Felspar, from Lord Kingston's cave, county Cork.

Draining tiles and pipes, made on Lord Stanley's property, near Tipperary.

Sands, white silica, found at Killonan, useful for heavy iron castings and other purposes. White silica, found near Caher, used for pottery, &c. Manganese, found at Springhouse.

Inorganic vitreous matter, the produce of green ash and elm, calcined in a brick-kiln by the exhibitor.

Water, from a well in the rock of Cashel, lately discovered, about 150 feet above the general level of the surrounding surface.

32 ———

A collection of minerals from the Mendip Hills, Somersetshire.

---

33 **TALLING, —**, *Truro*—Producer.

Sundry minerals from Truro.

34

Minerals from Liskeard, Cornwall.

35 **IPSWICH MUSEUM COMMITTEE**, by the Rev. J. HENSLOW, President—Producer.

Sundry minerals obtained from the neighbourhood of Ipswich, and used in the arts, as manure, for cement, and for some other purposes.

[These minerals from the neighbourhood of Ipswich include the cement-stones found at Harwich and dredged off that coast; the recently obtained nodules, containing phosphate of lime, now rendered available for agricultural purposes, and existing abundantly near Felixtow; and some other materials, all tending to illustrate the mineral riches of the district. Similar collections for other localities would be of great interest in local museums, and might be collected on a large scale at very small cost.—D. T. A.]

---

36 **PAINE, JOHN M.**, *Farnham*—Producer.

Phosphoric fossils and marls from the upper greensand, the gault, and the upper part of the lower greensand formations. These fossils are stated to contain as high a percentage of phosphate of lime as ordinary bones; and they have been proved to be useful in fertilizing land. They are easily converted into superphosphate of lime, by the agency of sulphuric acid. The clean fossils contain from 50 to 70 per cent. of bone-earth phosphate; the green marl (without fossils) contains from 4 to 15 per cent. The substances found are characterised by the almost total absence of carbonic acid, and are, therefore, the more valuable as a material for forming superphosphate of lime. These phosphoric fossils are to be found in greater or less quantities at the bottom of the chalk range of hills throughout England. The fossils and marls are chiefly dug from the lands of the exhibitor at Farnham, in Surrey.

Transverse section of pocket of hops of the choicest "Golding" variety, grown upon the phosphoric marl of the "upper greensand." Entire pocket of the same as prepared for sale.

Specimens of phosphoric fossils from the mammaliferous crag of Suffolk; and of the "Mineral Phosphate of Lime" or "Apatite," from Estremadura, in Spain, and from New Jersey, in the United States.

[The concretions of phosphate of lime, which were discovered by Mr. Paine in the cretaceous rocks near Farnham, in a state well adapted for economic use, and which are much employed for agricultural purposes, appear to exist in two or three bands in the upper greensand and gault, not extending into the true lower greensand. The concretions are occasionally formed about an organic centre, and appear to be instances of segregations of a mineral substance at one time generally distributed in a bed while being deposited at the bottom of a sea. The phosphoritic nodules are usually found in the Farnham district associated with green earth.—D. T. A.]

---

37 **LANCE, EDWARD JARMAN,** *Frimley, Bagshot, Surrey*—Producer.

Specimens of minerals, in their raw state, as used in the arts (as iron from the Wealden formation, and the coal measures, &c.), arranged in trays, and named.

Specimens of minerals, used as manures, as phosphate of lime and magnesia; sulphate of lime and alumina Cornwall sand, shell marl, &c.

Specimens of cultivated soils or earths, arranged as they occur from London to Cornwall, being the abrasions of minerals.

Specimens of corn produce; the effect of the admixture of fertilizing minerals and culture on silicious sand, in illustration of the preceding collection.

Geological map of the British Isles.

---

38 **GILL, WILLIAM EATHORNE,** *Truro*—Inventor.

Specimen of Normal guano, a manure: prepared from the refuse of the fisheries, as a superior fertilizer.

This manure is obtained from precisely the same source as the Peruvian guano; the sample exhibited was a conger-eel. It is chemically prepared with all its agricultural advantages undiminished. Fish refuse has ever been a well-recognised manure, especially along our coasts; but the demand has, for obvious reasons, been irregular, and the supply, as a consequence, still more so. By adopting, in our fisheries, the process of manufacture shown in the specimen, a regular market at all seasons of the year would be established, and the normal guano would thus become a means of supplying our farmers with a portable, cheap, and valuable manure.

[The large quantities of fish, particularly pilchards, mackerel, and hake, which are caught around the coast of Cornwall, render the preparation of a manure from the refuse, on most occasions, a comparatively easy undertaking. The value of fish manure has been long known, and it is not at all uncommon for farmers to go to considerable expense to obtain the offal from the nearest fishing towns; and they value highly the refuse salt, which they obtain after the pilchard season, from the curing-houses, on account of the great quantity of pot-oil it contains.—R. H.]

39 **GOULD, Rev. S.,** *Rectory, Beaconsfield.*

Samples of clay, chalk, and sands.

40 **SWEETMAN, JOHN,** *Sutton, County of Dublin*—Proprietor.

Blue limestone, containing about 90 per cent. of carbonate of lime. Dolomite, containing about 40 per cent. of carbonate of magnesia. Cement made with dolomite. Quartz rock for road metal. Steatite clay, for pottery or silicated soap. Silicated soap. Hæmatite iron ore. Black oxide of manganese, containing about 55 per cent. of oxygen. Umber. Yellow and brown ochre. White sand, for manufacture of glass.

[Dolomite occurs in various places in Ireland, in veins in the limestone districts, particularly where intruded rocks are near. On the south side of Belfast Lough, at Holywood, it appears also as a distinct rock in a stratum about 60 feet thick. The best kinds contain from 18 to about 22 per cent. of magnesia.—D. T. A.]

---

41 **TESCHEMACHER, E. F.,** *4 Park Terrace, Highbury*—Producer.

Collection of mineral and other manures.

42 **HARRIS, J.,** *2 Hart Street, Mark Lane*—Inventor and Manufacturer.

Fæcal manure, deodorised, containing the fertilizing properties essential to vegetation, and suitable for every description of soil and climate.

43 ———

Silt, sand, turf, &c., from the Isle of Ely.

---

44 **RAMSAY, G. H.,** *Newcastle* (Agent, A. HURST, *65 Mark Lane*).

Artificial manure, bone dust, and superphosphate of lime.

---

45 **MITCHELL, W. B.,** *Sheffield*—Producer.

Sandstones, for purposes of construction, and grindstones.

1. Millstone grit—Bull Hill Quarry. 2. Millstone grit—Reeves' Edge Quarry. 3. Blue sandstone—Green Moor Quarry. 4. Brown sandstone—Green Moor Quarry. 5. Blue sandstone—Brinkcliffe Edge Quarry. 6. Brown sandstone—Grenoside Quarry. 7. Brown sandstone—Wickersley Quarry. 8. Magnesian limestone—Steetley Quarry.

Clay.

9. Fire clay and brick—Dore Moor Mine. 10. Fire clay, for crucibles—Storr's Mine. 11. Balbro brick clay; pressed brick.

Coals.

12. From Soap House Colliery—Sheffield Bed. 13. From Birley Vale Colliery—Sheffield Bed. 14. From Mortomley Colliery—Sheffield Bed. 15. Handsworth converting coal. 16. Tinsley Park high hazel coal. 17. Tinsley Park furnace coal.

46 **NESBITT, J. C.,** *Kennington*—Producer.

Phosphate fossils for manure.

47 **CAWLEY, JAMES,** *Pendell, Bletchingley*—Producer and Manufacturer.

Stone from the surface of fuller's earth, used for building purposes.

Fuller's earth in the raw state, blue and yellow.

Fuller's earth, blue and yellow, dried and prepared for use in the manufacture of woollen cloths, flannels, blankets, Scotch tweeds, and tartan shawls.

Specimen of the spar found in the strata of the fuller's earth.

All the above specimens were found and dug at the "Cockley pits" at Nutfield, Surrey.

[The fuller's earth pits of Nutfield, near Reigate, are extensively worked, and supply large quantities of this substance to the clothing districts. There are two kinds, one greener than the other, owing to the presence of silicate of iron; but both exist under the same geological conditions, occurring in the lower cretaceous series, and differing little in chemical condition.

Fuller's earth consists of about 45 silica, 20 alumina, and 25 water. When placed in water it almost dissolves, and when exposed to great heat it melts. It combines readily with grease, forming a kind of earthy soap, and for this reason is valuable in the manufacture of cloth made of animal fibre.—D. T. A.]

48 GAWKROGER & HYNAM, 7 *Prince's Square, Finsbury*—Manufacturers.

Fuller's earth, and purified dried fuller's earth, from Chart Lodge, Reigate, Surrey, and Cormonger's Pits, Nutfield, Surrey.

[Fuller's earth, and its localities in England, are above described. The following is the mode of purifying and preparing the raw material for use:

The fuller's earth, after it comes from the pit, is baked or dried by exposure to the sun, and then thrown into cold water, where it falls into a powder, and the finer parts are separated from the coarser by a method of washing in several tubs, through which the water is conducted, and where it deposits the different kinds in succession. These are used for different kinds of cloth, the coarser part for the inferior and the fine for the better kinds of cloth. The soapy combinations formed by fuller's earth with the greasy portions of cloth during the process of fulling, are supposed to serve the purpose of mordants in some measure.—D. T. A.]

49 WILSON, Sir THOMAS MARYON, *Charlton, Kent*—Producer.

Sands and loams for casting, from Charlton, next Woolwich; sands used for glass and house purposes from Hampstead.

50 ROCK, JAMES, jun., *Hastings*—Producer.

Lignite found in the summit tunnel of the Hastings and Ashford railway, 1½ miles to the N.N.E. of Hastings, about 90 feet from the surface, and 300 feet above the sea level. The strata dip from N.W. to S.E. at an angle of about 65 degrees.

Clinker, containing a considerable quantity of iron, from an ancient cinder-bank on the property of Hercules Sharpe, Esq., Sedlescomb, Sussex.

Claystone, said to contain oxide of chromium.

Fine white sand, from Hastings cliffs.

[The lignite of the Hastings sand formation, near Hastings, has been long known, and corresponds in every particular with the lignites from Tilgate Forest. It occurs in nearly horizontal bands, thinning out into a mere film, and the largest masses do not exceed a few inches in thickness. It is very brittle, and burns with a bright flame; resembles jet, and contains included fragments of ligneous character. It is not unlike the Bovey coal.

stone was formerly extracted from some of the ferruginous sands of the Wealden, either in irregular concretions, hard, compact, and of steel-grey colour inside, or laminated, and often concentric. In some places it is of excellent quality, and when the country was covered with forest was much used in the manufacture of charcoal iron.—D. T. A.]

51 ROSS, THOMAS, *Claremont, Hastings*—Producer.

Iron ore from the neighbourhood of Hastings.

Tilgate stone from the East Cliff, Hastings.

Hastings "granite" (locally so called).

Clay, from a large bed lying under the sand-cliffs to the eastward of Hastings.

Hastings hone-stone, rough and prepared.

[The clay near Hastings underlies a thick deposit of white sand and friable sandstone, called the "Worth beds." The clay itself contains undulating seams of lignite. It overlies another bed also including lignite.—D. T. A.]

52

Specimen of fossil orthoceratite.

53 WHITTAKER, JAMES, *Wirksworth, Derbyshire*—Proprietor.

Specimens of marble, and vase made of the same.

Specimens of grit sand, used for fine castings.

White sand, used for scouring, &c.

White lead ore, and stalactite.

54 BRODIE, PETER B., F.G.S., *Down Hatherley, Gloucester*—Producer.

1. Limestone, from the Purbeck strata in the Vale of Wardour, Wiltshire, applicable to purposes of lithography.

2. Ironstone, from the top beds of the lower lias, Robinswood Hill, near Gloucester, Hewlett's Hill, near Cheltenham, and Chipping Campden, Gloucestershire; it occurs in beds, and occupies a considerable area in the Cotswold hills.

3. Septaria, found in the upper beds of the lower lias, Robinswood Hill, near Gloucester, in sufficient quantities to be used for cement.

4. Iron pyrites, or sulphuret of iron, found in digging a well in the lias at Gloucester.

5. Limestone, forming an extensive bed in the lower lias near its base, and extending through Gloucestershire and Somersetshire.

6. Hard limestone of the lower lias, near Bidford, in Warwickshire. This stone takes a polish, and could be used as a marble.

7. Bone bed, a thin but extensive band at the base of the lower lias, charged with fragments of bones, teeth, and coprolites, which might be beneficial as a manure. It occurs at Wainlode Cliff, Coombe Hill, near Gloucester, Westbury-on-Severn, Somersetshire, and Wales.

[All the above specimens, except the first, are from the lias, a deposit of calcareous clay widely distributed in the west of England, and ranging from the coast of Dorsetshire, at Lyme Regis, to the coast of Yorkshire, at Whitby. The upper and lower beds are often shaly, and yield materials for the manufacture of alum and other substances. The middle portion is more calcareous, and includes some bands of compact limestone. Where the carbonate of lime forms into nodules somewhat argillaceous, there are found septaria well adapted to the making of cement. In many places, the iron disseminated through the clay has collected into bands of impure ironstone, which, however, is not likely to come into successful competition with other ores. The bone-bed may, if the expenses of transport be inconsiderable, be worth working as a cheap and effective mineral manure.—D. T. A.]

55 RIDDELL, Sir JAMES MILES, Bart., *Strontian*—Proprietor.

Various specimens of minerals.

Harmotome, in large crystals, on calcareous spar.

Morvenite, a variety of harmotome, on calcareous spar, amber colour.

Crystallized calcareous spar, with annular iron pyrites, enclosing radiated sulphate of barytes.

Brown calcareous spar.

Crystallized calcareous spar, of a pink colour.

Calcareous spar, on hexahedral tables enclosing icositetral crystals.

Hexahedral prismatic calcareous spar, penetrated with crystals of the same, of a different form, the obtuse solid angle of which partly protrudes from the terminal plane of the prism.

Brewsterite, discovered near Strontian.

Crystallized carbonate of strontian.

Massive fibrous carbonate of strontian, with heavy spar.

Sulphate of barytes with phosphate of lead.

Sulphuret of iron.

Gneiss. Gneiss passing into granite. Gneiss with red felspar.

Junction of gneiss with granite, intersected by a vein of felspar.

Fine-grained granites. Syenites.

Porphyritic granite.

Syenite, with a vein of felspar.

Rock, of carbonate of lime and serpentine.

Granite studded with garnets, from the summit of Ben Resipole, a mountain above 3,000 feet in height.

A very large specimen of the same.

Quartz rock.

Sulphuret of lead, in a matrix of calcareous spar, from the Smithy Vein (Feedonald district).

Sulphuret of lead with calcareous spar, a continuous string of lead ore, from the red vein of Feedonald.

Crystallized sulphuret of lead (the primary cube), from the same vein.

Sulphuret of lead, with sulphuret of zinc and crystallized calcareous spar in the cavities.

Sulphuret of zinc and calcareous spar, from Corantee.

Cubic sulphuret of lead with calcareous spar.

Sulphuret of lead in calcareous spar, from Clashgoram mine (middle district).

Sulphuret of lead; sulphuret of lead, embedded in calcareous spar; and sulphuret of lead, partly crystallized with calcareous spar—from Belsgrove Mine.

Junction of granite and mica slate.

Lias limestone; from the north side of the promontory of Ardnamurchan.

Lias limestone, from the south side of the promontory.

A large mass of sulphate of barytes, a substance constituting much of the matrix or veinstone of lead ore.

[At Strontian, in the western part of Argyllshire, a boss of granite is seen penetrating the gneiss, which abounds in the district; and a little further to the west, a large quantity of porphyry and trap occurs, covered, in two or three places near Ardnamurchan, by deposits of the oolitic and liassic period. In the granite, and near its junction with the gneiss, mineral veins are found, containing lead and copper; and in one of these was first observed the mineral thence called *strontianite*, or *strontites*, a carbonate of strontia, usually associated with calc-spar, sulphate of barytes, and galena. The metal called *strontium*, obtained from this mineral, was first described by Sir H. Davy, and resembles barium in its properties and appearance. Carbonate of strontia is chiefly used in the production of the nitrate which is employed in giving a red colour to fireworks.

Harmotome and morvenite are hydrous silicates of alumina and barytes. Brewsterite is also a hydrous silicate of alumina, but contains strontia as well as barytes. The other minerals are well known. The lias is one of several small patches round the trap rocks of Ardnamurchan, Morven, and the Isle of Mull, and contains numerous organic remains.—D. T. A.]

56 DANN, THOMAS, *Reigate*—Producer.

Greystone lime, from the lime-works, at Reigate Hill, on the estate of the Countess of Warwick.

57 WORTHINGTON, WILLIAM, *Northwich, Cheshire*—Proprietor.

Specimens of rock salt, as produced from the mines near Northwich, Cheshire.

Specimen of refined salt, for curing fish.

Fine high-dried table salt.

Malvern salt, much esteemed for table use.

Large-grained bay salt, used for various purposes.

[The salt-mines of Cheshire are worked in the new red sandstone of that county, the salt being in large masses of irregular form associated with marl and gypsum. In its natural state it is of dull red colour, semi-transparent, and though sometimes cubical in crystal, more usually massive. The number of saliferous beds in the district is five, the thinnest of them being 6 inches, but the thickest nearly 40 feet thick, and they are worked at a depth of from 50 to 150 yards below the surface.

The mode of working the thick bed is not much unlike that adopted in South Staffordshire for coal; but the roof being generally uniform and tolerably tough, and the mine without noxious gases, the works are more simple. The salt is blasted, and large pillars are left to support the roof. Upwards of 60,000 tons of salt are obtained from the Cheshire mines, and a large quantity is also manufactured from brine-springs and other similar sources, in Cheshire and Worcestershire. The greater part is exported from Liverpool.—D. T. A.]

58 HILL, JOHN, *Ringsend, Dublin*—Manufacturer.

Basket and pink salt for table use; Irish fine, or butter salt, and coarse or provision salt.

[There are no natural deposits of salt in Ireland, and the various kinds exhibited by and prepared in that country are generally procured from the English salt mines.—D. T. A.]

59 - -, *Brassington, Derbyshire*—Producer.

Wad and white-lead ore.

60 ROAKE, JAMES WHITE, *Newbury, Berkshire*—Producer.

Specimens of soils which surround Newbury, Berks, and the uses to which they are applied.

Nos. 1 to 4. Various clays. 5. White. 6. Red. 7. Yellow ochre. 8. Fine white sand. 9. Coarse sand. 10. Ferruginous sand. 11. Ochreous sand, used by iron founders. 12. Green sand, with oysters embedded. 13. Gravel, rough and pebbly. 14. Calcined pebbles, reduced to coarse and medium grit. 15. Fine pebbles, with stucco made from it, to compare with a coloured fragment and tessera from Herculaneum. 16. Chalk from Kintbury, with shells peculiar to that deposit. 17. Whiting. 18. Limestone. 19. Stone lime. 20. Chalk lime, through which gas has passed. 21. Peat from the Kennet valley. 22. Peat, condensed by Cobbold's patent process. 23. Peat, pulverised for horticultural uses, and disinfecting purposes. 24. Peat ashes, for the agriculturist.

Samples of bricks, tiles, and pottery.

[Newbury is situated on the lower tertiary beds immediately overlying the chalk, which crops out at a short distance from London to the north, south, and west. The river Kennet crosses the chalk from the west, runs through the town towards the east, and enters the Thames near Reading. The tertiary deposits here include a moderate thickness of the London clay overlying the mottled clays and sands of the lower or plastic clay series, including a pebble bed, mottled red clays and sands, and the whole covered up with a little gravel.—D. T. A.]

61 COWPER, JOHN, *Alston, Cumberland*—Proprietor and Producer.

Crystal of sulphate of barytes; the largest on record, weighing 112 lbs.

Specimens of witherite, or carbonate of barytes, remarkable for their beauty and crystallization; taken from a lead and carbonate of barytes mine at Fallowfield, near Hexham, Northumberland, where it is raised in the lump, in great abundance. It is extensively used in the manufacture of glass, chemicals, porcelain, &c. This extensive mine, now the property of Walton and Cowpers, was thrown away as of no value, until lately, when the present proprietors bought the mines, and introduced the article, as a mining product, into the market.

Sulphate of barytes, found in witherite.

Bromlite (baryto-calcite) on bitterspar and pseudomorphous quartz; from Brownley Hill. Barytes and galena, from Fallowfield. Coal, galena, shale, &c. Carbonate of lime, from Alston.

62 **DYER, WILLIAM BUNT**, *Mold*—Proprietor.

White lead ore, carbonate of lead ore, from Jamaica mine. Assay, 60 per cent. for lead, and four ounces of silver per ton of lead.

Blue lead (galena) and sulphuret of lead ores from Jamaica mine. Produce 80 per cent. lead and four ounces silver per ton of lead. It is used by potters for the purpose of smoothing earthenware glaze.

63 **CAIRNS, J., jun.**, 96 *Charlotte Street, Manchester*—Producer.

Carbonate of barytes, with specimens of lead ore, from Anglezark Moors, near Chorley, Lancashire.

64 **BROOKMAN & LANGDON**, 28 *Great Russell Street*—Proprietors.

Specimens of black lead from Cumberland, in the raw state, and as hardened for use. Specimens of other minerals.

[The Cumberland graphite is obtained from a large and very irregular vein cutting through the green slate and porphyry; and the mineral occurs in large lumps, found here and there expanding and thinning out with no apparent order. About 50 years ago, one of the largest masses ever discovered was suddenly met with, and yielded about 70,000 lbs. of the purer kind of black lead. Since then there has been nothing found of any value. The mines are near the head of Borrowdale, the entrance being about 1,000 feet above the sea, and as much below the summit of the mountain.—D. T. A.]

65 **BROCKEDON, W.**, 29 *Devonshire Street, Queen Square*—Patentee and Manufacturer.

Native plumbago:—Samples from the mines of Borrowdale in Cumberland, fine and crude: from Ceylon, Davis' Straits, Spain, Bohemia (called Mexican), Greenland, California, France (Poligny): nodules from India, &c.

Samples of Cumberland black lead, prepared for condensing into blocks by patent process.

Specimens in powder, purified from grit, and in fine powder, ready for condensing, which has passed through apertures $\frac{1}{50000}$th of an inch in diameter.

Blocks which have been condensed by a pressure of 5,000 tons.

Slices of the blocks for pencil-makers; points for Mordan's ever-pointed pencils; cedar pencils, by various makers, of Brockedon's patent Cumberland lead.

Blocks made of Ceylon and other plumbagos, &c.

The plumbagos exhibited in their natural state, are—Three very fine samples of the old black-lead, formerly found in Cumberland. The only native plumbago which could be cut into slices, and used in its natural state; the miners have long failed to supply such specimens. Two samples of Cumberland lead, containing too much grit to be used without purification. Samples of plumbago from Ceylon, crystalline and fibrous: this is the purest plumbago known, being 98·35 pure carbon; but it is too fragile for use in cedar. Two samples from Davis's Straits and Greenland. One from California. Others from Spain and Bohemia (called Mexican), of these two the common pencils are made, when hardened by sulphur. From none of these can a fine pencil be made, but the Cumberland.

The manufactured blocks are from the second variety of the Cumberland, freed from grit, and reduced to an impalpable powder, of which a quantity is shown to form one of the blocks. From this powder the air is exhausted, when it is condensed in a dry state by an enormous pressure, which consolidates a mass weighing seven ounces under a force, in two blows, with a force of 5,000 tons, leaving it as compact as the natural; and from these blocks slices are cut, as shown: these are inserted in channels in the cedar. It is also cut into the lengths of the block as square threads; these are rounded, then cut to the proper lengths for the ever-pointed pencils.

For the process by which the Cumberland lead can be freed from grit, and then solidified, the exhibitor obtained a patent, and pencil manufacturers use it only for their finest drawing pencils.

[Graphite or Plumbago, a form of carbon commonly called *black-lead*, and sometimes, but incorrectly, regarded as a carburet of iron, is a well-known soft mineral, crystallized in small hexagonal plates of laminated structure, infusible, burning with great difficulty under the blowpipe; consisting of from 85 to 98·55 per cent. of carbon, and having a specific gravity of 2·09 to 2·25; the purest being the lightest. It is found in metamorphic, generally in schistose, rocks, of various geological age, in masses or veins parallel to the lamination or stratification. The pure and valuable kinds are very rare, and have been obtained almost exclusively from the localities mentioned above. The variety from Ceylon is remarkably pure but soft; that from Greenland is also pure, but very hard. The latter, according to an analysis recently made by T. H. Henry, Esq., yields carbon 96·6, ash 3·4; but does not seem adapted for extensive use in pencil-making, owing to its hardness and paleness. It appears that the presence of a certain quantity of iron is favourable for its use in the arts.

The method by which Mr. Brockedon has rendered several of the softer and less compact graphites available, and has also brought into use the fragments formerly too small for pencils, has been successfully applied to other materials for various useful purposes.—D. T. A.]

66 **REEVES & SONS**, 113 *Cheapside*—Inventors and Manufacturers.

Cumberland lead and cedar wood, in the different forms n which they are used in the manufacture of drawing encils.

67 **ADAIR, R.**, *Maryport*—Manufacturer.

Various materials used in black-lead pencil making; ith specimens of pencil manufacture, in its different stages.

The cedar used is imported into London and Liverpool chiefly from South America. The foreign plumbago, of which common pencils are manufactured, is imported from Germany, the East Indies, Spain, and Mexico. The Cumberland black-lead is found only in Borrowdale, and is used only for the best pencils.

68 **WOLFF & SON**, *Church Street, Spitalfields*—Manufacturers.

A specimen of pure Cumberland lead, without grit, as produced from the mines at Borrowdale. Block of the same compressed. Specimens of prepared and compressed Cumberland lead.

[The Cumberland mines having failed to produce a continual supply of the pure plumbago, or black lead, for the use of artists, &c., the exhibitors are enabled, by their process of cleansing and compressing the crude or gritty lead, to produce solid blocks of pure plumbago equal to the finest quality originally supplied from the mines.]

Specimen of Ceylon black lead. East India, as produced from the mine. Block of Ceylon lead, prepared and compressed.

Specimen of Malaga black lead (Spain), as produced from the mines. Block of Malaga lead, prepared and compressed.

[Plumbago, or graphite, improperly called black lead, is a carburet of iron: the best quality of this is used for artistic purposes; the inferior is employed in the manufacture of crucibles, or chemical furnaces, as it stands a high temperature. It is adulterated with lamp black, sometimes to the amount of 60 per cent., when sold for domestic purposes.—R. H.]

69 **Banks, Son, & Co.**, *Greta Pencil Works, Keswick*—Manufacturers.

Specimens of pure Cumberland lead, and composition used in the manufacture of black-lead pencils. Specimens of the various stages of manufacture from the raw materials to the complete pencil. Specimens of pencils in various styles of finish.

70 **Rogers, Samuel Sandilands**, *Douglas, Isle of Man*—Producer.

Specimens of the earths and sands of the Isle of Man.

71 **Tennants, Clow, & Co.**, *Manchester*—Manufacturers.

Large groups of crystals of sulphate of copper.

72 **Thompson, J.**, *Northwich*—Producer.

Crystalline block of rock salt, quarried out of one of the exhibitor's mines, near Northwich. In the neighbourhood of Northwich are to be found the only mines of rock salt in England, numbering altogether about twenty distinct quarries. Rock salt has been an article of trade in this neighbourhood since the year 1670; it was then carried on the backs of horses to the nearest point of embarkation. Now the exports to foreign countries alone, are about 70,000 tons. The total consumption being about 100,000 tons. The rock salt is found from 45 to 50 yards below the surface, the intervening layers being composed of soil, gravel, quicksand, clay, marl, gypsum, &c. The first bed of rock salt is about 25 yards in thickness, but inferior in quality; underneath this, is a bed or stratum of stone or indurated clay, blue and brown, about 10 yards in thickness; below this is the second great formation, which is also about 25 yards in thickness; the lower five yards of which is the only portion excavated, the greater mass being very impure. That within five yards, however, contains but few impurities, and is readily dissolved into brine, from which is manufactured the purest and best of salt.

The above specimen is not selected as a rare and pure block, but as a fair representation of the bulk of what is obtained from the mine.

---

73 **Claxton, J.**—Producer.

Sands from Alum Bay, Isle of Wight.

74 **Squire, John & William**, *Yarmouth, Isle of Wight, Hampshire*—Producers.

Specimen of pure white sand, used in the manufacture of best flint glass, taken from horizontal and vertical beds in the cliffs in Alum Bay, near the Needles, on the estate of William George Ward, Esq. It is exported from Tamworth, and is extensively used by glass-makers, for its silicious properties.

[The geological position of these beds of sand is at the base of the tertiary series, as exhibited in the British Islands, corresponding with the white and other sands at Woolwich, and the lignites and plastic clays of Paris. The thickness of this part of the series at Alum Bay is very remarkable; and the sands being nearly free from iron and alkaline earths, are well adapted for glass-making.—D. T. A.]

75 **Collinson, Charles**, *Mansfield*—Proprietor.

Red casting sand, found only at Mansfield, and of value in the production of fine castings. Its qualities are fineness of grain, porosity, great purity and smoothness, which latter property contributes to give a high face to castings.

---

76 **Relf, S.**, *Reigate, Surrey*—Producer.

White sand, from the Tunnel Caves at Reigate (called in use "silver sand"), dug from the rock.

77 **Morrison, George**, Agent of **Earl Somers**, *Reigate*—Producer.

Sand from the common, named Reigate Heath, valued for its grit, and used in the manufacture of glass.

[These sands are from certain beds of the lower greensand series much developed in Surrey, and frequently exhibiting extensive tracts of sand, often without admixture of any argillaceous or calcareous matter.—D. T. A.]

---

78 **Long, J., C.E.**, *Limerick*—Producer.

Building and ornamental stones from Limerick, &c. Sands and earths from the river Shannon.

Nos. 1 to 18.—Marbles of various colours, obtained from the top beds of unworked quarries. The lower beds contain specimens of a better quality, and free from the blemishes which these exhibit. Worked in the counties of Limerick, Clare, King's County, Longford, and Galway.

Nos. 19 to 28.—Building-stone, of various qualities of limestone and grit, from quarries at Limerick, and at various points along the Shannon. No. 23 yields the Hydraulic lime, now used in building the new docks at Limerick. No. 59 is a stone adapted for inside staircases, and not readily soiled. These stones are suitable either for marble or building stone.

No. 29.—Iron-stone; No. 30, iron nodule; and No. 31 bituminous coal, from county Leitrim. No. 32, anthracite coal. The iron ore and coal, Nos. 33, 34, 35, are found in the same district on the verge of the Shannon, near its source, whence a steam navigation extends to Limerick. Limestone, suitable for flux in smelting, as well as moulding sand, fire-clay, fire-stone, &c., are found in the same locality. The iron-stone is productive, nearly equalling the black band ore of Glasgow, and exceeding the Staffordshire and Welsh ores; the richest giving 61 per cent. of iron. The coal (No. 35) produces $\frac{5}{6}$ parts of good coke, and is useful for illuminating purposes. Anthracite coal (No. 36) is found in Tipperary, Limerick, Kerry, and Clare, where extensive coal fields exist; but owing to the abundance of peat fuel in the district, they remain unworked, except for local purposes, such as burning lime, drying corn, &c.

Nos. 37, 38.—Turf, heavy and light, found in abundance, and chiefly used for domestic purposes.

No. 39.—Gypsum, obtained on the shores of Lough Allen, at the head of the Shannon, near the coal and iron mines, county Leitrim.

No. 40.—Fire-clay. This clay is found of excellent quality, and equal to the Stourbridge clay, formerly imported into Limerick.

Nos. 41, 42.—Moulding sand; the same, prepared for use. These sands are used in the Limerick foundries.

Nos. 43, 44.—Building sands; dredged out of the bed of the river at Limerick, and requiring no screening or washing previous to use.

No. 45.—Plaster sand, dug in pits near Limerick.

No. 46.—Lime; produced from the building stones of the locality, which are found in abundance throughout the whole length of the river.

[The coal worked near Limerick is from a number of small basins or troughs, ranges of hills running east and west, and the strata dipping on either side often at high angles. The coal is all anthracitic, and there appear to be six distinct seams, three of them however yielding the principal supply. The iron-stone of Ireland is generally rich, some of it especially, averaging as much as 40 per cent. of iron in the natural state. The fire-clays from beds alternating with the coal, and others in the counties of Clare and Tipperary, afford admirable material for crucibles, and replace Stourbridge clay for various purposes.—D. T. A.]

No. 47.—Flags. Flags of this kind of large dimensions are obtained in the county Clare. Exported from Limerick.

No. 48.—Copper ore, from the Hollyford mines, county Tipperary.

Lead ore, from Ballyhickey mines, formerly worked, but not now in operation. Within four miles of the shipping port of Clare. Average, by assay, 77 per cent. for lead, and 15 ounces for silver in the ton of lead.

Shell marl; dredged in abundance out of the Shannon; it forms the subsoil of the lowlands skirting the river.

Silica. This silica is suitable for pottery purposes.

[Shell-marl, such as alluded to in the above list, is usually the remains of the deposits formed by the ancient pleistocene sea. The organic remains which give richness to this marl, and enhance its value for agricultural purposes, are remarkable for being of an arctic character. They appear to indicate the ancient extension of an icy sea like that of Greenland over the greater part of the British Isles during the geological epoch immediately preceding the present era.—E. F.]

79 **Rouse, Capt., & Whitley, N.**, *Truro*—Producers.

Specimens of sands, from various parts of Cornwall, used for agricultural and building purposes: the agricultural sands from Gwithian, Falmouth harbour, and Perran Porth; the others used for building purposes.

[A very large quantity of fine white calcareous sand, consisting chiefly of minute fragments of shells, and containing much animal matter and some salt, is annually removed from the coast of Cornwall, in some places, to the interior, and used for agricultural purposes, for which it is well adapted. It has been estimated that as much as from six to eight millions of cubic feet of sand are annually thus removed.—D. T. A.]

80 **Flather & Haden**, 1 *Castle Mills, and* 2 *Broad Lane, Sheffield*—Producers.

Prepared Trent sand, or wharpe, used for buffing up, or bringing to a surface, German silver, Britannia metal, brass, copper, &c.

Prepared Welsh rotten-stone, used for producing the fine polish on silver, Britannia metal goods, &c.; when mixed with one-sixth its weight of rape or sweet oil, it forms the polishing paste used for cleaning Britannia metal. brasses, tin ware, and other bright metal goods.

[Most substances employed under the name of rotten-stone, or Tripoli, are essentially composed of silica in a peculiar state of subdivision, the actual particles of which the whole is made up being crystalline, but the mass earthy, and often reduced by compression to a solid state, having a slaty fracture. In most cases, the origin may be traced to the remains of infusorial animalcules, and occasionally the presence of carbon, and a little resinous organic matter which shows this still more clearly. The name Tripoli is generally understood to apply to all the earthy varieties (of which there are several) in which silica exists nearly pure, but in a very minute state of subdivision. Rotten-stone is limited to those which are light and friable, and of very fine grain. It occurs rather abundantly near Bakewell, in Derbyshire, amongst the carboniferous limestones, but is often met with in other rocks.—D. T. A.]

Prepared lime, used for producing the bright black polish upon German silver, electro-plated, and silver goods.

81 **Solomon, Thomas**, *Truro*—Producer.

Varieties of hone-stones, used for sharpening edge-tools, from Perran Porth, near Truro; Lostwithiel; Feock, near Truro; Kenwyn, near Truro; and other localities.

---

82 **Scrampton**—*Leicester*—Producer.

Specimens of Whittle Hill whetstones and hones.

84 **Meinig, Charles**, 103 *Leadenhall Street*—Manufacturer and Dealer.

Circular grindstones, for glass, mineral teeth, fine tools, &c.; made of sandstone, from the exhibitor's quarry in Bohemia, producing fine edge, and polished surface.

Grinding lathe, mounted with these grindstones, with circular oilstones, &c. Mounting for flat oilstones, sharpening differently on different sides. Specimens of dressed oilstones.

Multiplying hand-frame for circular grindstones; oilstones and polishing stones on Mr. Eden M'Donall's principle.

Multiplying hand-frame, with horizontal movement.

[Grit stones or grinding stones are, all of them, varieties of sandstone; their abrading or polishing powers depending upon the degree of hardness of the stone; the size of the particles constituting the mass, and the silicious character of the stone. The Bohemian stones have long been imported from Germany, and used by jewellers for polishing small works, such as the settings around gems. These stones are fine and silicious, and for small work cut well, and keep a good point.—R. H.

This large and important series of grindstones includes almost every kind used for manufacturing purposes in London, and obtained for various parts of the world. The qualities of the stones, their relative excellence, and their respective uses will be easily understood by a careful examination of the series.—D. T. A.]

85 **Snow, W. P.**—Producer.

Specimen of rock from the Arctic Regions.

---

86 **Bank Park Pyropolite Works**—Manufacturer.

Figure in terra-cotta; a bas-relief ornament.

87 **Potter, William, & Co.**, 87 *Aldgate, and Cromford, Derbyshire*—Proprietors and Manufacturers.

Specimens of fluor spar, calcareous spar, calamine, white-lead ore, lead ore, sulphate of barytes, and sulphate of barytes manufactured as a pigment. From the Dinah, Goodluck, and other mines in the vicinity of Cromford, Derbyshire.

---

88 **Falmouth Local Committee**—Producer.

Quartz, pebbles, and sand, from Swan Pool, near Falmouth.

---

89 **Nicholls, J.**, *Truro*—Producer.

Fire-clay, used for stopping furnaces.

90 **Whiteway, Watts, & Co.**, *Wareham, Dorsetshire, and Kingsteignton, Devonshire*—Producers.

Blue clay, used in potteries, raised from the exhibitors' pits called Furzebrook, near Wareham, Dorsetshire.

Black and carbonaceous clay, for pottery purposes. Pipe clay, for making tobacco pipes. Top clay, for brown stone-ware purposes. Alumine clay. Draining clay, for draining tiles; all from the pits of Kingsteignton.

---

91 **King & Co.**, *Stourbridge*—Producers and Manufacturers.

Glass-house pot, made of Stourbridge fire-clay, for melting the ingredients of flint glass.

Model of glass-house furnace in fire-clay.

Segment of D-shaped gas retort, made of Stourbridge clay. Segment of round gas retort. These retorts are of greater durability than those made of iron.

Crucibles used in fusing metals.

Specimen of best clay, in its raw state, used in the manufacture of glass-house pots, peculiar to the Stourbridge district, and obtained from the mines of the exhibitors; and of the best black clay, used in the manufacture of crucibles, for melting steel.

[The well-known Stourbridge fire-clay consists of a material of considerable purity, existing in beds underlying coal in the coal-measures of the district. Similar beds of fire-clay, though rarely so good, occur elsewhere, and are extensively worked; but none have attained a reputation equal to that of Stourbridge in the manufacture of retorts and other fire-clay goods which have to sustain long-continued and intense heat. The chief excellence consists in the absence of iron and of alkaline earths (which would produce fusion of the clay), and a certain amount of porosity admitting of a little expansion and contraction. In the raw goods, the quality is not seen, but in those that have been fired, paleness of colour and the absence of cracks are considered good marks of excellence.—D. T. A.]

---

92 **JENKINS & BEER**, *Truro*—Producers.

Ochres, three in a powdered state, of different shades of colour, and one in lumps of two shades of colour; produced at Kea, near Truro; used in the manufacture of paints, paper-hangings, &c. Exhibited on account of their clearness, fulness of colour, body, and cheapness.

93 **JENKINS & COURTNEY**, *Truro*—Producers.

Specimens of Cornish china-stone, exhibiting its natural fracture: raised in the Great Bodilla china-stone quarries, St. Stephen's, Cornwall, and largely used in the potteries for the manufacture of the finer descriptions of china and earthenware.

[China-stone and china-clay, both of which are most extensively used in the potteries, are produced in the neighbourhood of the great granite ranges of Cornwall and Devonshire: in the former county chiefly from the St. Austell granite, and also from Tregorming Hill to the south of Helstone, and from the southern granite of Dartmoor in the latter county. The decomposed granite of St. Stephen's, and the uses to which it and the clay produced from it could be applied, were discovered in 1768 by Cookworthy of Plymouth, who was the first person who made hard porcelain in this kingdom. To this discovery is due entirely the manufacture of porcelain, similar to that of china.

The composition of this kaolin, or porcelain clay, varies in different localities, the average of the best Cornish clay giving an analysis—alumina, 24·6; silica, 44·30; lime, magnesia, and potash, 1·60; water, 8·74. The pure kaolin of Dartmoor being, alumina, 36·81; silica, 44·25; lime, magnesia, and potash, 2·20; water, 12·7.

With the increase of our porcelain and fine earthenware manufacture, the demand for these clays has largely increased; and to this must be added a large trade in the china-stone itself, which is used principally for glazing fine ware, the ordinary glaze being composed of decomposed granite, lime, flint, litharge, and borax.

A large quantity of this clay of an inferior quality is used by the paper-makers and calico-dressers, for the purpose of giving weight and body to their fabrics.

Men, women, and children are largely employed on these clay-works, which, when the clay is being dressed, present a scene of active and curious industry.—R. H.]

---

94 **THRISCUTT, C.**, *St. Austell*—Producer.

China-clay as dug out of the earth, from Caudledown Clay-works; prepared, burned, and calcined.

---

95 **WHITLEY, N.**, *Truro*—Producer.

Clays of the district of Truro.

---

97 **MINTON, H. & Co.**, *Stoke-upon-Trent*—Manufacturers.

A collection of the various materials used in the manufacture of all kinds of porcelain and earthenware.

1. *Raw material.*—Cornish clay in its natural state; and the same prepared for use; both from the Cornish Clay Company; the same fired. Cornish clay as prepared at Mr. Thriscutt's works, Caudledown; the same fired. Cornish stone from the Cornish Clay Company; the same ground and fired. Swedish felspar; the same ground and fired. Blue clay, from Fayle's works, Dorsetshire, in the raw state; the same fired. Blue clay from Whiteway's works in Dorsetshire; the same fired. Gravesend flint in its natural state. Flints calcined. Flints calcined and ground.

2. *Glazing Materials.*—East Indian tincal, or borax in its imported crude state. Boracic acid. Borax crystallized, from Mr. E. Woods of Liverpool. Oxide of lead. Fritt for glaze. Paris white. Soda. Potash. ~~Nitre.~~

3. *Colouring Material.*—Oxide of copper. Protoxide of nickel. Oxide of chromium. Oxide of tin. Peroxide of manganese. Oxide of zinc. Peroxide of cobalt. Smalt-blue. Oxide of antimony. Granulated gold. Granulated silver.

98 **HIGHLEY, SAMUEL**, jun., 32 *Fleet Street*—Importer.

Collection of rocks and fossils, stratagraphically arranged, to illustrate modern works on geology; from Dr. Krantz's establishment at Bonn.

99 **GREAVES, R.**, *Warwick*—Proprietor and Producer.

Two busts of Shakspeare, in cement.

100 **FAYLE, BENJAMIN, & Co.**, *Old Swan Lane, Upper Thames Street*—Proprietors.

Specimen of blue potters' clay, as dug from the pits at Nordon, Isle of Purbeck, county of Dorset; used for the manufacture of earthenware; said to possess greater strength of body, and to shrink less than many other clays when exposed to high heat.

101 **PHILLIPS, WILLIAM**, *Morley Works, near Plympton*—Producer and Proprietor.

1. Specimen of disintegrated granite from Morley Works, Devon, in which the felspar is in a decomposed state, pure, and in a large proportion, compared with the quartz, schorl, and mica.

2 and 3. Prepared china clay, or decomposed felspar, the result of washing; used chiefly in porcelain, fine and common pottery, calico-dressing, and paper-making.

4. Specimen of clay for fire-bricks and crucibles.

5. Plymouth porcelain, made by Cookworthy, the discoverer of china-clay in this country.

6 and 7. Porcelain made from Morley clay.

8 and 9. Pottery from this clay, made of 80 per cent. of clay, with flint and china-stone.

[A large quantity of china-clay is found on the south side of the Dartmoor granite, the quality of this clay being excellent, and the position exceedingly favourable for the supply of the Staffordshire potteries by railway carriage. The china-clay of Devonshire possesses much interest, not only by its excellent quality, but also as the material from which Mr. Cookworthy, the first manufacturer of porcelain in England, probably obtained his material. The process of purifying china-clay is at present simply mechanical, but is capable of much improvement, and the coarse parts of the clay are well adapted to the manufacture of brick of various kinds. The china-clay is obtained from the decomposition of particular varieties of granite.—D. T. A.]

10 and 11. Pottery of ordinary manufacture, with small proportions of china-clay, flint, and stone.

12 and 13. Bricks made from clay.

14, 15, and 16. Pottery and china, illustrative of the application and uses of this china-clay, which has a larger proportion of alumina than other china-clays, and is free from metallic oxides.

[The china-clay and china-stone used in the manufacture of the finer kinds of porcelain are chiefly obtained from decomposed granite; the felspar of the granite, under certain circumstances, yielding to the action of the weather, and parting with its alkaline earths, and the harder, heavier, and coarser parts of the granite removed by mechanical washing, either naturally or artificially. The purified material thus obtained is called *kaolin;* its specific gravity is from 2·21 to 2·26. Some of the finer kinds contain, when boiled for a short time in a solution of potash, about equal parts of silica and alumina, upwards of 10 per cent. water, and from 2 to 10 per cent. of free silica; the mineral being therefore represented by the formula $A : \ddot{S} : + 2\,\dot{A}q$.

The formula for felspar is $3\,A : Si_3 + K : Si_3$, the potash being often replaced by soda, and the nature of the change may thus be understood. The best china-clay in England is obtained from Cornwall and Devonshire.—D. T. A.]

102 PIKE, WILLIAM & JOHN, *Wareham, Dorsetshire*—Producers.

Potters' or blue clay, from the island of Purbeck, Dorsetshire, used in British and foreign potteries.

[The greater part of the best pottery produced in various parts of the world has Dorsetshire clay for its principal ingredient. Blue, or potter's clay, for making fine ware, should mix tough, be free from sand, burn a good colour, and bear a large proportion of flint. This clay is said to possess these qualities; and a piece of earthenware made by Messrs. T. J. and J. Mayer is exhibited, which contains no other but china-clay.]

Stoneware clay, used in the London and Bristol potteries for the manufacture of stoneware and drain pipes.

Pipe clay, for the manufacture of tobacco pipes.

Alum clay, for the manufacture of alum.

[A considerable quantity of clay fit for ordinary potters' work, and for the manufacture of tobacco-pipes, besides some alum schist, is obtained in the small peninsula called the isle of Purbeck, on the Dorsetshire coast. This little tract of land contains a curious series of cretaceous, Wealden, and oolitic deposits, among the latter is the Kimmeridge coal elsewhere described, and above the whole series are clays of the Hampshire basin, in the manufacture of which the coal is used. These plastic clays belong to the lowest tertiary deposits.—D. T. A.]

103 WEST OF ENGLAND CHINA STONE & CLAY COMPANY, *St. Austell, Cornwall* — Producer.

Specimens of china-stone and clay in the different stages of the process to which it is subjected prior to its being sent [illegible] the potteries and bleaching manufactories in various parts of the old and new world.

They are obtained from the most extensive and ancient china-stone quarries and fallow clay beds in Cornwall. The Company holds the exclusive right of working over 3,000 acres of this county. These products have taken the first position in the markets hitherto, especially in Staffordshire, where they are most extensively used, and highly valued.

The china-stone is exhibited in the state in which it naturally occurs; it forms the partially-decomposed granitic ranges which stretch through the centre of Cornwall, where quarries are formed for the purpose of raising it: and next in the state after it has been subjected to the heat of the oven for the purpose of testing its vitrifying properties.

The china-clay, or still further decomposed granite (the china-stone being, as it were, an intermediate stage), is found in large beds, where it is mixed up with the sand which formed a component part of the granite: this is termed the clay stope, of which there are one or two specimens; by trituration with water the clay is suspended and carried off from the sand, which is deposited in the passage of the clay water, to the pits in which it is allowed to stand, so that the suspended particles may fall to the bottom, and the supernatant liquor flow off; the clay deposit is then placed in pans, exposed to the warmth of the sun, and bleaching power of the atmosphere; when thoroughly dry, it is sent to the potteries in the state shown in the case, in large heaps of about 1 foot square: the process to which it is next subjected, that of burning, serves as the best test of its quality,—in which state there are one or two samples; and lastly, the combination of clay and stone shown in the manufactured article, the china cards of the Company.

104 TRUSCOTT, CHARLES, *St. Austell*—Producer.

Cornwall china-stone in its native state; as calcined; as ground; and as ground and calcined. Cornwall china-clay in its native state; as calcined; in a state for porcelain; and in a state for bleaching and paper manufacturing purposes.

105 GRIMSLEY, HENRY, *Oxford*—Designer and Modeller.

Terra-cotta statue of a female figure holding a dial, made in clay obtained from Shotover Hill, near Oxford. Clay, sand, and ochre, from the same place, showing fourteen different strata, to the depth of 25 feet.

106 BURNETT, NICHOLAS, *Black Hedley, Gateshead, Newcastle-upon-Tyne*—Producer.

Specimen of clay, found near Black Hedley.

Articles manufactured from the clay, by Messrs. Thos. Fell and Co., Newcastle.

[This clay is of particularly fine quality, and the material manufactured from it exhibits marks of this in the surface it presents, and its uniform tint.—D. T. A.]

107 MARTYN, ELIAS, *St. Austell*—Producer and Manufacturer.

Specimens of china-clay, or kaolin, used in the Staffordshire potteries, in bleaching, and in paper-making.

China-stone.

108 WHEELER, PHILIP, & Co., *St. Austell*—Proprietors.

China-clay, or "kaolin," for the manufacture of earthen and china ware.

Bleaching clay, used in the cotton and paper manufactures.

Clay, exported to France, &c., for the extraction and manufacture of alum.

China stone from quarries in the parish of Germoe, Cornwall.

[The china-clay quarries in the adjoining parishes of Germoe and Breage, were the first worked in this country; and from this clay the earliest Plymouth china was made. —R. H.]

109 BROWNE, WILLIAM, *St. Austell*—Proprietor.

Specimen of china-clay, derived from the decomposition of felspar, extensively used in the manufacture of china, porcelain, and parian, for ornamental vases, busts, and all articles that require particular care and delicacy in moulding; and employed in the patent manufacture of ornamental stone, facing, flooring, and tiling, various articles of furniture, &c.

[A very large quantity of valuable china-clay and china-stone are found naturally, and prepared artificially in Cornwall and Devon, chiefly from the St. Austell decomposing granite, and the southern granite of Dartmoor. About 14,000 tons of prepared and 30,000 tons of natural china-clay are annually exported, chiefly to the potteries. D. T. A.]

110 **MICHELL, SARAH**, *St. Austell*—Producer.

White china-clay, for manufacturing china and earthenware, also for bleaching paper, calico, &c.

111 **WANDESFORDE, Hon. CHARLES**, *Castlecomer*—Proprietor.

Specimens of anthracite coal. Iron-stone. Fire-clay for fire-bricks. Slate-clay, for flooring-tiles, milk-pans, flower-pots, &c. Clay for making draining-tiles. Sand, for fire-bricks and moulding.

111A Specimens of china-stone and china-clay.

112 **BEAMISH, —.**

Carbonate of barytes in lump and powdered.

112A Specimens of fire-clay.

113 **PHIPPARD, THOMAS**, *Wareham*—Proprietor.

Potters', and pipe or brown clay, from Carey pits, with ware and tobacco pipes made from them; also silicious sand, for the manufacture of glass.

115 **KING, GEORGE**, *Demidge Lodge, Gazeley, near Newmarket*—Manufacturer.

Red brick earth as dug from the pit. Red building bricks, pamment bricks, and coping bricks made from the earth.

116 **ENNISKILLEN, the Earl of**, *Florence Court.*

Two kinds of clay, and drain pipes and tiles made of them.

117 **SQUIRES & SONS**, *Stourbridge*—Producer.

Model of a glass-house furnace, with pots of Stourbridge fire-clay, showing one in a working state; and of a pot, in which the glass is melted.

118 **ANSTEY, S.**, 10 *Devonshire Street, Hoxton Fields*—Manufacturers.

Pots for melting iron, brass, gold, silver, antimony, &c.

119 **FISHER, FREDERICK**, *Woolpit, Suffolk*—Manufacturer.

Specimens of Woolpit brick-earth.
White building bricks.
Pamment bricks and draining pipes.

120 **WALKER, R.**, *Victoria Works, Beverley*—Manufacturer.

Carbonate of lime, from the quarry, Victoria Works, Beverley; and Paris white, manufactured from it.

121 **DEERING, JAMES**, *Middleton, Cork, Ireland*—Producer.

Various materials obtained at Rostellan, county of Cork, Ireland, adapted for use in the manufacture of the better kinds of porcelain and earthenware. These include samples as raised from the mine, which was opened in 1850, and the different substances as used in the arts, and articles of earthenware and glass, manufactured from them.

122 **PEASE, JOSEPH**, *Darlington*—Producer.

Coal, from Pease's West Collieries, used for general purposes.

Coke manufactured from the coal.

Fire-clay, from above and below the coal. The same material in different stages of manufacture.

Ware produced from the fire-clay.

Fire-bricks, pipes for sewerage and agricultural drains, coping ridge-tiles, paving quarries, &c.

123 **HODSON, Sir G., Bart.**, *Hollybrooke Bray, County Wicklow, Ireland*—Proprietor.

Silicious sand formed by the decomposition of the quartz rock of the Sugar-loaf Mountain in County Wicklow. It is found in all shades of colour, from pure white to dark orange, the latter being acquired by its admixture with a metallic substance. It is used in the manufacture of porcelain.

123A **LONG, JOHN E. E.**, *County Roscommon*—Producer.

Specimens of drain pipes.

124 **SMEDLEY, THOMAS**, *Well Street, Holywell*—Producer.

Sand for glass making, and clay from Landidno.

124A **JOHNSTONE, WILLIAM**, *County Leitrim*—Producer.

Specimens of drain pipes.

125 **LEE, JOHN, LL.D.**, *Hartwell, near Aylesbury*—Proprietor.

Samples of fine washed sand, from a sandhill in the parish of Stone, near Aylesbury.

White, yellow, blue, and green glass prisms, made from the same.

Two spheres of white glass, made from the same sand.

[These sands are from soft beds of the lower green-sand series, of which there is a considerable thickness, forming a knoll at Stone. There is about 8 feet of whitish sand below 7 feet of sand and sandy clay, containing impure fuller's earth. The lower green-sand terminates a little to the west, and is succeeded by the beds of Portland stone, forming a distinct ridge near Hartwell, but covered and obscured by beds of gravel.—D. T. A.]

126 **METHVEN, DAVID, & SONS**, *Kirkaldy, Scotland*—Manufacturers.

Drain-pipes, with collars; registered drain-pipes, with improved methods of joining, to save collars. Drain-pipes, showing a new method of joining the leading drains with the main. Sewer or water pipes.

Ventilating roof-tiles, for stables or granaries.

Vandyke border edgings.

Mugs; a new method of dipped turning; a cheap imitation of printing.

127 **NORTH DEVON POTTERY COMPANY**, *Annery, near Bideford*—Manufacturers.

Raw clay as raised from the pit.

Gravel or sand, from the bed of the River Torridge, near Bideford.

Mixture of clay and sand, prepared for manufacturing.

Sewerage pipes of different dimensions and forms.

Strong and cheap water-closet pan, for cottages, &c.

Hollow brick, ornamental ridge and garden tiles, &c. made from the same.

127A

Pipe-clay pipes, and sand for glass-making.

128 **BULLER, T. W.**, *Bovey Tracey Pottery, Devon*—Producer.

Specimens of lignite or Bovey coal.

Specimens of earthenware fired with Bovey coal, and showing the colour of the Kingsteignton clays. This is the only instance in which lignite has been successfully applied to the firing of earthenware in England. Extensive deposits of lignite exist both in France and Germany; but De Brogniart (Traité des Arts Ceramiques, vol. i., p. 222) says, that no one has yet succeeded in the manufacture of earthenware with this fuel except at Elbogen, where it is used mixed with other coal.

Patent stilts and cockspurs used in the manufacture of earthenware.

[The Bovey coal is a thick bed of lignite, of comparatively modern date, and existing in the state of bituminized wood, generally coniferous. It is brittle, and leaves a considerable quantity of white ash when burned. It seems a lacustrine deposit, and extends seven or eight miles, having in some places eighteen or twenty beds of lignite, varying in thickness from one to three feet.—D. T. A.]

128A **GORE, CHARLES WILLIAM**, *Moreton-in-Marsh*—Proprietor.

Brown ochre, in its raw state, used for staining and for common purposes. In its raw state it is a stone colour, and is used for houses, glass-houses, &c. When calcined, it is of a deep brown colour, and is used for facia, iron-work, &c.; it has a strong grit, and requires the use of machinery to pulverize, grind, and prepare it.

---

129 FAHIE, J. K., *Tipperary, Ireland*—Producer.

White and black clay. Draining tiles and pipes. Felspar, from Cork.

129A COOPER, S.—Producer.

Specimens of drain pipes from the river Shannon.

---

130 WHITE, JOHN BAZLEY, & SONS, *Westminster*—Manufacturers.

Case, containing specimens of cement stones and those producing plaster of Paris, as used in England for building purposes; showing the raw stone, the powder calcined and ground, and cubes of cement in a set state. There are two kinds of cement stones: of each kind, as well as the gypsums, it may be well to say a few words.

1st. Natural cement stones. These include the Sheppey stone (Kent), and the Harwich stone (Essex), which produce different varieties of the cement known as Roman cement, introduced by Dr. Parker about 50 years ago. These are both from the older tertiary deposits, and so also are the Hampshire cement stones found at Christchurch, Romsey, &c., which produce the Medina cement. The Whitby stone (Yorkshire), is found in the lias formation, the cement produced being known as Atkinson's cement. At Wolverhampton and in Derbyshire cement stones occur in connection with iron-stone, which imparts to them a ferruginous tint. At Weymouth (Dorsetshire) similar materials are obtained from the Kimmeridge clay, but these are not extensively used for building purposes. Other districts yield natural cement stones, but the above mentioned are those most known in commerce: they are used very largely, both as mortars and stuccoes.

2nd. Artificial cements:—Portland cement is composed of carbonate of lime and the argillaceous deposit of the Medway and other rivers. These materials produce a cement of superior quality, both as to strength and colour. A large panel on a wall, representing a Roman Doric window opening, shows the colour of this cement, and its adaptation for external stucco. In illustration of its strength as a connecting material between bricks, stone, &c., are shown:—a beam of brickwork, loaded with a heavy weight, indicating the value of bond courses of brickwork in cement, and the resistance they oppose to superincumbent weight and cross strain. A beam of tiles bedded in Portland cement, adapted for flooring purposes. Cubes of stone connected by Portland cement, showing its adhesive power as great in stone as in brick. Bricks made of Portland cement, to test its resistance to tensile force. Blocks of Portland cement which have been subjected to hydraulic pressure, to prove its resistance to compression. Portland cement combines with gravel, rubble-stone, &c., to form excellent concrete or beton; specimens are to be seen in parts of a block in concrete stone made at the Digue of Cherbourg, under the direction of Mons. l'Ingénieur Reibell; size of blocks, 15ft. by 8ft. by 6ft.; weight, 45 tons; specimen two years old. Part of a block made at Dover Harbour works, under the direction of James Walker, Esq., which has been exposed during three years in an isolated position to the action of the sea and shingle. Part of a block of concrete stone, made at Alderney harbour works; composition, 1 part cement to 10 parts gravel; weight of blocks 4 to 6 tons. Part of a block of concrete stone, 2 years old; the cement was used in a liquid state.

Gypsums, or sulphates of lime, are found in many parts of England, particularly Derbyshire, Nottinghamshire, and Cumberland; and when calcined and ground they produce the material known in commerce as plaster of Paris; and in combination with alum they produce the hard artificial cements known as Keene's, Martin's, and Parian patent cements. Keene's cement is composed of sulphate of lime and alum; the intimate chemical combination of these materials effected by calcination imparts to the stuccoes made from them, extreme hardness, by which they are adapted for use in those parts of buildings where strength and durability are required, such as skirtings, columns, pilasters, and mouldings of all sorts; and they are not liable to be injured by fire, vermin, &c. As specimens of Keene's cement are shown — a skirting moulding, worked in the common quality of Keene's cement; two pavements, of which the ground is the common quality, and the inlaid borders of the finer quality; large panel on wall, second quality, adapted for painting. Specimens, showing that in combination with colours, brilliant and forcible imitations of marbles, granites, &c., may be produced, the effect being aided by gilding and inlaying; large panel on wall, and pavement, illustrating the effect of colouring in this material, and its applicability to inlaid work, after the style of Florentine mosaic, at a cost not much exceeding the price of polished vein marble.

[There are three very different processes of manufacture in the case of hydraulic cements and artificial stone, the one consisting of an admixture of caustic lime (with or without magnesia) with silica in a gelatinous state, thus producing in the final result a hydrous silicate of lime; a second, consisting of sulphates of lime burnt with alum; and the other, composed entirely of silica, and forming, in fact, a kind of glass. Each class of artificial stones will be found noted in describing the objects exhibited by different persons. The hydrous silicates of lime, manufactured artificially, consist, as noticed above, of carbonate of lime mixed with argillaceous earth, and calcined with sand or powdered flint, when the alkali, acting on the silica at a bright red heat, produces a mass which, with the subsequent addition of water, becomes permanently solid. D. T. A.]

130A PIPER, T. & W., and WHITE & SONS—Importers and Manufacturers.

Wall panel executed in *French plaster*, showing its application as a hard and quick-setting internal stucco in place of lime rendering.

131 BLYTH & JACOBS, 44 *Baldwin's Gardens, Gray's Inn Lane, Holborn*—Manufacturers.

Gypsum dug from the pits; calcined, and prepared for manure. Specimens of plaster of Paris, with a collection of articles in the same.

[Gypsum (hydrous sulphate of lime) occurs in various ways and various places very abundantly. In a semi-crystalline form it is called *alabaster*, and in crystals *selenite*. In the same combination without water, it is called *anhydrite*.

Most of the gypsum used in the manufacture of plaster of Paris is obtained from tertiary deposits, of which enormous masses exist in the neighbourhood of Paris, especially at the heights of Montmartre. This stone contains above 7½ per cent. carbonate of lime, and 3 per cent. clay, which greatly improves the strength of the cement made from it. It lies between marly beds, and is of fresh-water origin; but other beds equally extensive are of the triassic series occurring with common salt, and others again in the oolites of the Alps.

Large quantities of gypsum are obtained from Lincolnshire (Newark) and also from Derbyshire—the best from the latter place.

The gypsum, heated from 250° to 270° Faht., parts with the whole of its water, and is changed into an anhydrous sulphate. In this state it is reduced to a fine powder, and then, on being again mixed with water, becomes warm, and rapidly solidifies. This is not the case, however, if the temperature of calcination has been too high, since if it reaches 320° the water is absorbed very slowly. The mode of calcining varies with the object required, the plaster used in constructions being less carefully burnt than that intended for fine casts. A harder and more perfect plaster than the common kind is sometimes made by adding alum during the process of calcination. This material dries more slowly, but is smoother than the ordinary plaster, and has a certain degree of transparency. The use of gypsum as manure depends on its supplying to certain soils lime and sulphuric acid.—D. T. A.]

131a **M'Anaspie, P. & T.**, 31 *Great Brunswick Street, Dublin*—Manufacturers.

Various samples of hydraulic and Portland cements, adapted for all kinds of building work, both useful and decorative:—they are the first ever manufactured in Ireland, and are all taken from the Irish mines.

Specimens of Oriental marbles, in scagliola, used for the interior decorations of houses.

Specimens of green granites, verd antique, Sienna, black and gold, rousse brocade, and brocadelia.

Specimens of green, blue, and yellow cements, adapted for tessellated and mosaic flooring, &c.

[The ancient Romans paid particular attention to their cements and mortars, the durability of which is attested by the remains of their walls: their renowned hydraulic cement is said to have been prepared with a mixture of volcanic sand and lime. Hydraulic cements are such as have the property of hardening under water, and are prepared by the calcination of argillaceous limestone, or with mixtures of lime and argillaceous earth. It appears from the acute researches of M. Vicat, that silica is an essential element in the formation of a good hydraulic cement, the setting of which he attributes to the basis, silicate of lime, passing to the state of hydrate by the absorption of water; for he found that alumina and magnesia did not give to lime the property of hardening under water, although they do not prevent the process of induration: he believes that the oxides of iron and manganese do not contribute in any way to the goodness of the cement.—W. D. L. R.]

131b **Dyer, C. K.**—Producer.

Patent metallic cement.

131c Block of gypsum from county Monaghan, Ireland.

132 **Gowans, James**, *Edinburgh*—Proprietor.

Group in freestone, designed and executed by A. Handyside Ritchie, 92 Prince's Street, Edinburgh.

This stone is from Redhall quarry. According to the analysis of Dr. George Wilson, of Edinburgh, the average percentage of peroxide of iron is not more than ·052. It is said to possess the property of hardening by exposure to the weather, and of retaining its primitive surface.

Specimen of freestone, from Binny quarry, forming the plinth of the group.

Dr. Wilson, in his analysis, says, "This building stone which has been in use for many years in Edinburgh, has been analysed by me, and found to contain the same percentage of peroxide of iron as the Redhall freestone, and I find that it exhibits the peculiarity of having diffused through it a quantity of native bitumen or asphaltum which acts as a protective varnish to the stone, and defends it from the action of the atmosphere."

Specimen of Binny quarry bitumen candles, made from the nearly solid bitumen or mineral wax, which is diffused through the stone, and exudes in considerable quantity between its layers. Owing to its abundance, the workmen use it for domestic purposes.

Specimen of bitumen from Binny quarry, in its natural state. It has been found by Dr. Wilson to yield, on distillation, paraffine, and a liquid hydro-carbon analogous to naphtha.

Model of a steam crane, with travelling gear, worked from a horizontal shaft, and capable of raising 20 tons.

Drawing of a steam crane, worked by crab gearing, attached to a horizontal steam-engine, and capable of raising 50 tons.

Drawing of a boring machine, capable of boring holes to a depth of 40 or 50 feet, from 3 to 6 inches in diameter; used in conjunction with a galvanic battery for separating the large masses of rock in the quarry. It is stated that masses weighing upwards of 6,000 tons have been dislodged by this operation from their beds. It is proposed to apply the same method to the working of coal-[illegible] blasting of submarine rocks, &c.

133 **Freston, William**, *Hawthorn Cottage, Stroud*—Producer.

Building-stone from Painswick Quarries; from Sheepscombe, and from Nailsworth Quarries.

134 **Maxwell, Wellwood**, *Munches, Dalbeattie, Scotland*—Proprietor.

Slab of granite from Craignair quarry, near Dalbeattie, Stewartry of Kirkcudbright, showing some of the styles in which that stone may be dressed and polished. The value of this granite has been tried in the Liverpool docks and similar works; it is adapted for ornamental architecture.

135 **Voss, James**, *Woodyhide, Corfe Castle*—Proprietor.

Purbeck marble, from quarries at Woody-hide, Corfe Castle, used in decorating the interior of the Temple Church, London; also used for dairies, hall tables, mantelpieces, &c.

[The Purbeck series of beds occurs at the base of the Wealden formation, and immediately overlies the Portland series. It is best developed in the Isle of Purbeck, where it has a thickness of 275 feet, 55 feet of the upper part of which is useful stone. The beds called Purbeck marble consist, for the most part, of small *Paludinæ*, cemented by carbonate of lime with much green matter. Other beds are composed of bivalves of the genus *Cyclas*. They are all used for building purposes.—D. T. A.]

136 **King, Thomas**, *Morpeth*—Producer.

Block of freestone, from a quarry at Hartford Bridge, Northumberland, belonging to the Earl of Carlisle, with the proprietor's coat of arms cut thereon.

The quality is shown by the fact, that a bridge adjoining the quarry was built of this stone more than 600 years ago, and the marks of the mason's chisel are still visible on it. The same stone was used in the building of Miss Burdett Coutts' church in Westminster; and in repairing Windsor bridge. This stone is quarried by the exhibitor and shipped at the port of Blyth.

137 **Sim, William**, *Inverary, Argyleshire*—Producer and Manufacturer.

Granite from the quarries at Inverary and Bonaw, Loch Etive, and from the Island of Mull, manufactured and arranged so as to illustrate their capabilities for works of utility, and for ornamental purposes.

Model of a street, with the causeway, gutter, and kerbstones full size, in their respective positions.

Cubes of granite, showing the various kinds of workmanship generally put on granite; namely, coarse picked, fine picked, nidged, or axed, and polished.

Three ballusters of Bonaw fine-grained granite, hewn with the hammer and chisel.

Three slabs of polished granite.

The granites of Inverary and the fine-grained granite of Bonaw are remarkable for hardness and extraordinary resistance to tear and wear. They have been extensively used in paving the streets of Glasgow; and officially certified by the Lord Provost and Town Council of that city to be the best ever used for that purpose.

[The granite of Inverary consists of distinct patches, protruding through the gneiss. The granite is of fine quality, and much used. It is of two kinds, the one containing mica and red felspar, and the other hornblende and white felspar with the quartz.—D. T. A.]

138 **Lentaigne, J.**, *Tallaght House, Dublin*—Proprietor.

Limestone from Sutton, county Dublin, and from Clane, county Kildare. Porphyry, from Lambay Island, county Dublin.

139 **Gelling, Frederick Lamothe**, *Castletown, Isle of Man*—Producer.

Marble, obtained from Coshnahawin and Skillicore, in the parish of Malew, Isle of Man, exhibited in several forms, to show its capabilities—in the rough, with one face polished; table in five pieces; turned specimens; a vase, &c. It can be raised of large size, and of great variety.

Red porphyry, and agate or pebble, with polished faces.

[The limestone of Skillicore and Coshnahawin is of the carboniferous period, and is broken up into rhomboidal blocks, the intervals being often filled with quartz. The rock exhibits a beautiful variegated appearance, but is too much fractured, and appears to be too hard to be worked with profit as a marble.—D. T. A.]

140 **Colles, A.**, *Marble Works, Kilkenny, Ireland*—Manufacturer.

Bust pedestal of Kilkenny marble, from the Black Quarry.

141 **Meredith, James Henry**, *Fowey, Cornwall*—Proprietor.

Slab of black porphyry, polished on both sides.

Slab of red porphyry, polished on both sides.

Slab of green porphyry, polished on one side, and partly polished on the other.

Tessellated porphyry table, containing 54 specimens of indigenous stones raised in the parish of Withiel, in the county of Cornwall, from a porphyry quarry, which has been worked for fourteen or fifteen years; it was polished in the mills at Fowey Castle Mine, in the parish of Tywardreath.

Porphyries are principally used for ornamental architecture, such as floorings, ceilings, and sides of rooms, passages, porches, and entrances of various descriptions; tables, recesses, tessellated pavements, monuments, columns, &c.

142 **Rossmore, Lord**, *Rossmore Park, Monaghan, Ireland*—Proprietor.

Specimen of green granite from Rossmore Park, county Monaghan.

143 **Courtown, Earl of**, *Courtown House, Wexford*—Producer.

Block of jasper.

144 **Franklin, Plimeas Lewis**, *Galway, Ireland*—Proprietor.

Block of black marble, with polished surface. Black marble columns for statues, from quarries on the banks of Lough Corrib, near Galway; used also for ornamental marble works, monuments, tombs, &c.

145 **Malahide, Lord Talbot de**, *Malahide Castle, Londonderry*—Producer.

Specimens of Irish verd antique.

146 **Hall, Joseph & Thomas**, *Marble Works, Derby*—Manufacturers.

Series of pieces of Derbyshire black marble, arranged in a columnar form, showing the process of turning, polishing, &c., from the rough block to the finished article.

Similar series in Derbyshire alabaster, to illustrate the mode of manufacturing from the raw material.

148 **Manderson, W.**—Producer.

Marbles of Ireland, of various colours, prepared at the Killaloe marble works, on the banks of the Shannon, and raised in the neighbouring districts. Exported from Limerick.

149 **Damon, Robert**, *Weymouth*—Proprietor.

Polished slabs of septaria, or turtle stone, from the Oxford clay formation, Weymouth, Dorset.

[The septaria, of which these are favourable specimens, are obtained from all the principal clays found in England, and consist of concretionary portions in which the carbonate of lime, at first disseminated through the whole mass, had collected, during or before the final drying of the bed. The carbonate of lime, afterwards crystallizing, occupied a still smaller space, as it was deprived of all extraneous matter, and the crevices thus formed, have subsequently been filled up. There is often an organic centre to the concretions of which the septaria formed. The name septaria is derived from the Latin *septum*, an inclosure.—D. T. A.]

150 **Monteiro, Luis Antonio**, 2 *Upper Phillimore Place, Kensington*—Producer.

Specimen of stalagmite, or Oriental alabaster, veined in colours, from Granada.

151 **Quilliam & Creer**, *Castletown, Isle of Man*—Producers.

Slabs of Poolvash black marble, inlaid with red and yellow composition, to imitate encaustic tiles. Invented and designed by the Rev. J. G. Cumming.

Plain polished slab of Poolvash black marble.

Table of Poolvash grey shelly marble, with encrinital column.

National tile one foot square. Poolvash black marble, with the arms of England, Scotland, Ireland, Wales, and the Isle of Man, in figures inlaid in red.

Slab of black marble, for chess table, inlaid with various marbles of the Isle of Man.

Marble candlesticks.

Wreath of flowers in Poolvash black marble.

152 ———

Building material found in Sussex.

153 ———

Specimens of Irish building stones.

153A **Trenchard, Trenchard John**—Producer.

Specimens of stone from the Roxwell quarry, near Weymouth.

154 **Sparks, W.**, *Crewkerne*—Collector.

Specimens of stone from the counties of Dorset, Somerset, and Devon:—

Greensand, a silicious stone, from Blackdown Hills, Devon, used as a whetstone for scythes, &c.

Purbeck marble; Purbeck stone; Portland stone. Building stone from Ridgway; and limestone from Langton Herring, near Weymouth.

Building stones, white and calcareous, from Bothenhampton, near Bridport, and Beaminster, Dorset; also from Bath, Doulting, near Wells, and Crewkerne, Somerset.

Ferruginous stone, for public buildings, mill-dams, &c., from Hamdon Hill, Somerset.

Blue lias limestone, for docks, railways, &c., from Lyme Regis, Dorset, from Curry Rivell, near Langport, and from Keinton, Somerset.

White lias, from Beer Crowcombe, and from Twerton, Somerset. Gypsum, from the former place.

New red sandstone, from Bishop's Lydiard, near Taunton, Somerset.

Millstone grit, for paving, &c., from the Pennant quarries, Hanham, near Bath.

Carboniferous limestone, from St. Vincent's rocks, Clifton; from the Breakwater quarries, Plymouth, from Newton-Abbott; and from Kingskerswell, near Torquay, Devon.

Granite, from Dartmoor, Devon, used for Government works, Stonehouse.

Marlstone or middle lias, from near Ilminster, Somerset.

Mountain limestone from the Mendip Hills, near Shepton Mallett, Somerset.

[Many of the stones referred to in the above list are of considerable value and interest. The whetstones first alluded to are manufactured from hard sandy concretions, found in the lower cretaceous rocks on the west part of the Blackdown hills, and quarried from galleries driven as much as 300 yards into the hill side. These concretions vary from 6 to 18 inches in diameter, and form a bed about 4 feet thick, available for scythe-stones. The beds above and below are employed for building purposes.

The inferior oolites, worked at Crewkerne as building stones, are not specially remarkable for excellence, but the Hamdon-hill stone is durable and valuable. The Pennant grit is a rock much employed for building and engineering purposes, and belongs to the coal measures.

The granite of Stonehouse and Dartmoor is a valuable and durable material.—D. T. A.]

155 ——

Slab of green Connemara marble from the D'Arcy estate.

156 ——

Mountain limestone from Weardale.

157 **CUMMING, Rev. JOSEPH GEORGE**, *Castletown, Isle of Man*—Producer.

Pale marble (carboniferous limestone), from Scarlett, Isle of Man. Exported from Castletown. Castle Rushen (900 years old), King William's College, St. Thomas's church, Douglas, and Castletown pier, are built from these quarries. It is durable, and easily raised.

158 **CHAMPERNOWNE, H.** *Dartington House, Totness*—Proprietor.

Cubes of polished Devonshire marbles.

159 **TENNANT, JAMES**, 149, *Strand*—Mineralogist.

The maps of the Ordnance Survey, geologically coloured by the officers of the Geological Survey of the United Kingdom.

160 **FREEMAN, WILLIAM & JOHN**, *Millbank Street, Westminster*—Producers.

Several varieties of material used for constructions, namely:—

Granites from Lamorna, near Penzance; from Constantine, near Helston; from Carnsew, Mabe parish, and Polkanago, Stithian's parish, near Penryn; from Zennor, near St. Ives; and from Rosemorran, Gulval, Cornwall. Foggintor granite, county Devon; Aberdeen granite, and Peterhead granite, from Stirling Hill quarries, Aberdeenshire; Dalkey or Dunleary granite, county Dublin; Ireland, and Guernsey and Herm granite used for macadamising roads. Polyphant stone from Lewannick, near Launceston.

Limestones.—Purbeck marble, from Swanage, Dorset; the top vein in the quarry, used anciently in churches and cathedrals. Purbeck stone, called Laning vein, the second stratum from the top, used chiefly for door steps and street kerbs; freestone, third vein, used chiefly for building; stone, from Down's Vein, fourth from the top of the quarry, used for footway paving; stone, called feather, fifth vein, used in church building; stone, five bed and cap used for carriage-way paving and building purposes; Portland. Portland stone, from West Cliff and from Bill quarries; from the Waycroft quarries; from the Trade quarry, and from the Vera Street quarry, all in the isle of Portland. Portland roach, the upper part of the regular stone beds; the lowest bed, used for troughs, sinks, &c. Bath stone, from the Farleigh Down quarries; from the Box quarries, and from Coombe Down quarries. Limestone, from Hooe lake, Plymstock; used for agricultural purposes, for footway pavements, and building. Caen stone, from the quarries of M. Jobert.

Magnesian limestone, from the estate of the Misses Gascoigne. Huddlestone stone, near Sherburne, Yorkshire.

Sandstones.—Darley Dale stone, from Stancliff quarry, near Bakewell, Derbyshire; Cromwell bottom stone, from the estate of Samuel Freeman, Esq., Southowram, near Halifax, Yorkshire. Bradford stone, from the quarries at Heaton. Potter Newton stone, and Gipton wood stone, from the neighbourhood of Leeds. Bramley Fall stone, from Meanwood quarries, near Leeds; and from Horsforth quarries, near Leeds. Gazby stone, from quarries near Bradford.

Kentish rag, from the quarries of Mr. Bousted and Mr. Seager, near Maidstone.

Fire-stone, from the quarries of Mr. Stedall, Godstone, Surrey.

Slates and Schists.—Caithness slabs, used very extensively for paving.

Valentia slate stone, from the island of Valentia, Kerry, Ireland: the slate is non-absorbent; experiments made by Messrs. Bramah showed that inch cubes required nearly six tons to crush them.

Marble.—Green, and black marble, from the estate of Mr. Martin, county Galway, Ireland.

[Most of the materials commonly used in construction in London are illustrated in the above collection. The Cornish granites and the Portland stones may, however, be selected as requiring notice here. Of the former, those shipped from Penryn are the best known; but the quantity annually exported varies very greatly, and the qualities are also variable. The different kinds exhibited will give some idea of their appearance. The Portland stone is well known, and very excellent, but costly, and rather heavy; it contains 95 per cent. carbonate of lime, 1 silica, and 1 carbonate of magnesia: specific gravity = 2·145, and cohesive power moderate. The upper beds above the freestone are the *top-cap*, *skull-cap*, and *roach*, the latter forming a good stone; the next bed is the best or *top-bed*, from 3 to 8 ft. thick, and this is succeeded by the middle or *curf-bed*, and an inferior bottom bed. The position of the Portland stone is in the upper part of the upper oolites.—D. T. A.]

161 **HUTCHISON, JOHN**, *Monyray, near Peterhead*—Proprietor.

Bust and pedestal in blue Peterhead granite.

162 **NICHOLLS, JOHN**, *Trekenning, St. Colomb*—Proprietor.

Block of porphyry or elvan-stone, raised near Newquay, Cornwall; it is said to resist the action of the weather.

163 **LOCAL COMMITTEE, FALMOUTH and PENRYN**—Producer.

Stone, from Porkellis, Wendron, suitable for building, roads, chimney-pieces, or tables. Stone from Forest-gate, Stithians; and from Church Town, about two miles distant; from Mylor, near Penryn; and from Wendron.

Granite, from Wendron.

Stone, for road-making, extensively used on the Truro, Penryn, and Redruth trusts, from Pasko and Treluswell quarries, Gluvias. Stone, from Steven's quarry, Higher Treluswell, Gluvias; and from Newham, Kea.

Specimen of porphyry, found near Swan Pool, Falmouth, containing crystals of rhomboidal quartz.

Quartz pebbles and sand, from Swan Pool beach.

Magnetic iron ore, from Treluswell, near Penryn.

[A large quantity of excellent road-stuff is obtained in Cornwall from the "*elvans*," or porphyritic dykes, which traverse many parts of the county: these elvans also supply the chief building stones of the district. They are, however, not unfrequently met with in a decomposing state, and are then quite unfit for use. The stones obtained from Porkellis, near Wendron, sometimes nearly resemble sandstones. Many excellent stones, both granite and elvan, are obtained near Penryn. The decomposing porphyries and elvans yield occasionally valuable fire-clay.—D. T. A.]

164 HICKS, THOMAS, *Truro*—Producer.

Varieties of porphyry, for various purposes.

[The porphyries of Cornwall and other districts, where the primary and protrusive rocks prevail, have been neglected up to the present time. In the decoration of Osborne, and some other of the royal residences, ornamental stones of British porphyries, and other ornamental stones, have been used. Many of them are of a beautiful description, susceptible of the highest polish, and all very durable. The greenstones, or as they are sometimes called ironstone porphyries, are now being introduced into London for road-making, and it appears to prove an exceedingly good material for that purpose. —R. H.]

165 WHITLEY, NICHOLAS, *Truro*—Producer.

Varieties of porphyry.

166 ST. AUSTELL COMMITTEE—Producer.

Specimens of building material.

167 LISKEARD COMMITTEE—Producer.

Specimens of building material, prepared in cubes.

169 RODD, T. H., Esq., *Trebantha Hall, near Launceston*—Proprietor.

Varieties of porphyry, for ornamental and building purposes.

170 JENKINS & STICK, *Truro*—Proprietors.

Varieties of porphyry, from Tremone, in Withiel.

170 A ———

Specimens of limestone glazed.

171 SOWDEN, MATTHEW, *Burley, near Leeds*—Producer.

Hard delf-stone grit, from a quarry at Burley, near Leeds, close-grained, strong, and durable; suitable for headstones, steps, &c., and generally for erections exposed to the weather.

172 FREEMAN, SAMUEL, *Cromweld Bottom, near Halifax*—Producer.

Laminated flagstone, from Pearson Brow Quarry, in Hipperholme, Yorkshire, and from Northowram, near Halifax, from Cromweld Bottom and Southowram, and from Hove Edge and Elland Edge, Yorkshire.

Blackstone, from Ringby, near Halifax, and from the Elland Edge Quarry, a bed free from laminæ.

All these stones lie above the two known lowest beds of coal in England, and below the level of the other beds. The laminated stones are split into flags for paving, &c.

Sandstone from the quarries at Greetland, near Halifax, Yorkshire; it lies below the level of any of the known beds of coal.

[The lower coal measures of Yorkshire contain some excellent grits, well adapted for building and paving. Some of the latter are well known and very widely used throughout England.—D. T. A.]

173 ———

Set of dressed blocks of oolitic freestone.

174 HAIGH, JOHN, *Godley Cottage, near Halifax*—Producer.

Specimens of freestone from Northowram quarries, near Halifax. Block, in its natural state; block, variously dressed.

Flag, for causeways and floors of buildings.

Millstone grit, from Halifax.

175 JOHNSTONE, GEORGE, *Craigleith, Edinburgh*—Producer.

Stone from Carlingnose quarry, North Queensferry, Scotland. This stone has been extensively used in Scotland, England, and Wales; more especially at Her Majesty's dockyards at Woolwich, Sheerness, and Chatham; for the breakwater at Warkworth (Northumberland); at Newcastle, Sunderland, and Hartlepool; and in paving the Imperial Museum at St. Petersburg.

Stone from Barnton Mount quarry, near Edinburgh: this stone can be procured in large blocks, and in any quantity. Specimen of paving stones from the same granite quarry.

Specimen of stone from Craigleith quarry, near Edinburgh; much used for stairs, landings, and fine pavings; may be seen applied to those purposes at the British Museum, Royal Exchange, Custom-house, &c., London.

[The Craigleith stone is a sandstone of the carboniferous series, consisting of fine quartz grains with a silicious cement, and occasional plates of mica. It is obtainable of any practicable length and breadth, and up to 10 feet thick. Weight, per cubic foot, 146 lbs. It consists of more than 98 per cent. of silica, and 1 per cent. carbonate of lime.—D. T. A.]

176 LUARD, BEEDHAM, & CO., *Caen, Normandy, and Caen Sufferance Wharf, Rotherhithe*—Proprietors.

A specimen of Caen stone, wrought on face.

Four specimens of ancient Caen stone, from St. Stephen's Chapel, Westminster, 16th century; St. Stephen's Church, Caen, 11th century; and Kingston Church, Sussex, 14th century; all in good preservation.

Four specimens of Aubigny stone, wrought.

Three specimens of ancient Aubigny stone from churches at Calvados department, and from the old castle of William the Norman, of the 12th, 16th, and 17th centuries.

A specimen of Ranville stone, from quarries near Caen.

Three specimens of Scotch granite, of which blocks of 30 tons can be obtained.

[The Caen stone, obtained in large quantities and of the finest quality from the quarries at Allemagne, has been long worked, and is well known in all parts of England and France, being used in many of our cathedrals and other public buildings. The quarries are entered by narrow galleries opening from the steep banks of the river Orne, and thus have the advantage of direct water communication at very small cost.

The stone is soft in the quarry, of very beautiful rich cream colour and very even texture. It stands exposure well in France, but is better adapted for internal work in the climate of England. Several very beautiful works in this material will be found amongst the mineral manufactures (Class 27), and in other parts of the building.—D. T. A.]

177 **SMITH, TILDEN**, *Vine Hall, Hurst Green*—Proprietor.

Limestone, raised from a quarry on the property of Samuel John Nicoll, Esq., in the parish of Mountfield, Sussex.

Two blocks of concrete, formed with the Mountfield stone lime. One block has been kept in a damp place since 1850; the other has been kept dry. The Mountfield lime is especially adapted for submarine works, as it possesses the valuable property of hardening under water.

[The limestones of the middle part of the Wealden formation occur in the lower or Ashburnham group, and include a series of shelly limestones and shale resembling the Sussex marble. Extensive lime-works have been long carried on near Battle, and the rocks are found to be much disturbed with faults.—D. T. A.]

178 **BARRY & BARRY, THOMAS and JACOB**, *Mawgan St. Columb*—Producers.

Firestone, a soft-grained elvan or porphyry, from quarries near Newquay, used for lining limekilns and furnaces.

[The elvans (porphyritic dykes) of Cornwall are used for various purposes of construction, but it is only occasionally that they yield firestones.—D. T. A.]

179 **KIRK & PARRY**, *Sleaford, Lincolnshire*—Proprietors.

Specimen of Ancaster stone, of the lower oolite formation, from the quarry at Wilsford, near Sleaford, Lincolnshire. It is said to be a durable building material, used chiefly for dressings and architectural decorations, and adapted for sculpture and ornaments of various kinds. It rises in beds, varying from 10 to 24 inches in thickness: the texture is close and uniform; and it is stated that although it can be cut with an ordinary peg-tooth saw, like the Bath oolite, it will carry an arris equal to that of Portland stone.

[Ancaster stone is a fine cream-coloured oolite, cemented by compact, and, often, crystalline carbonate of lime. There are numerous beds, the entire depth of workable stone being 13 feet, and blocks of 3 to 5 tons being obtainable. The stone weighs 139 lbs. 4 ozs. per cubic foot; absorbs very little water; cohesive power tolerably high; composition—carbonate of lime 93·6, carbonate of magnesia 2·9, with a little iron and alumina, and a trace of bitumen. Belvoir Castle, Belton House, and numerous mansions and churches in Lincolnshire are constructed of this stone.—D. T. A.]

180 **FOOT, JOHN**, *Abingdon Street, Westminster*—Proprietor.

Specimens of Best Bed Portland stone, and Whit Bed Portland stone, showing different samples of workmanship.

Specimens of Roach Portland stone. The backs show natural fractures.

181 **STAPLE, THOMAS**, *Stoke-under-Hamdon, near Yeovil*—Producer.

Blocks of Ham-hill stone (oolite), partially prepared to show the quality of the stone.

182 **RUTHERFORD, JESSE**, Stone Merchant, *Wingerworth, near Chesterfield*—Producer.

Stone from Wingerworth quarry, near Chesterfield, Derbyshire.

Stone from Lion quarry, Wooley Moor, near Wingerworth, Chesterfield.

Stone from Bramley Fall quarry, Wingerworth, near Chesterfield: this stone is generally used in heavy works such as docks, bridges, &c.; the quarry has been known upwards of 500 years: the stone is obtained in blocks 45 feet long, 20 feet broad, and 16 feet thick, each block weighing about 1000 tons.

[The Bramley Fall stone is a light ferruginous brown sandstone, with an argillo-calcareous cement and very little mica. It weighs 142 lbs. 3 oz. to the cubic foot.—D. T. A.]

---

183 **WALSH, JOHN**, Executors of, *Leeds*—Proprietors.

Sandstone, from the millstone grit series, used for docks, bridges, locks, engine beds, &c.

Potternewton stone, used for landings, sills, &c.

184 **PRICE, J.**, *High Street, Gateshead, Newcastle-upon-Tyne*—Proprietor and Inventor.

Freestone, from a quarry in Gateshead, used for building furnaces for glass-houses.

185 **GRISSELL, THOMAS**, 11 *New Palace Yard, Westminster*—Producer.

1. Specimen of magnesian lime stone, used in the construction of the New Houses of Parliament, Westminster, from quarries at Anston, in Yorkshire, belonging to the exhibitor, on the estate of the Duke of Leeds.

2. Specimen of this stone, dressed and polished.

Specimen of the same stone, forming part of an enriched parapet, at the New Houses of Parliament, Westminster.

[The magnesian limestone used in the outside work of the Houses of Parliament was selected on the recommendation of a Royal Commission, and after careful examination, as the finest available material to be obtained. It is a compact semi-crystalline rock, consisting of nearly equal proportions of carbonate of lime and carbonate of magnesia. It is of uniform and elaborate hardness; not very costly, either to obtain or work; weathers well, and of good colour, and is remarkable for its power of resisting compression. It is much heavier than most limestones, weighing upwards of 150 lbs. to the cubic foot.—D. T. A.]

186 **TOWNSEND, RICHARD**, *Clearwell, near Monmouth*—Producer.

Forest stone for steps, coping, &c.

Ashlar blocks for paving, grave stones, wharf walls, and all kinds of buildings; from the Forest of Dean.

---

187 **LINDLEY, CHARLES**, *Mansfield*—Proprietor.

Twelve-inch cube of magnesian limestone, or dolomite from the Mansfield Woodhouse Quarries, re-opened 1840, after a lapse of several centuries, to obtain the supply of stones for the erection of the new Houses of Parliament at Westminster. Chemical analysis:—Carbonate of lime, 51·65; carbonate of magnesia, 42·60; silica, 3·70; water and loss, 2·05. The débris is largely used for the production of carbonic acid gas and Epsom salts.

White calcareous sandstone. Chemical analysis:—Silica, 51·40; carbonate of lime, 26·50; carbonate of magnesia, 17·98; iron alumina, 1·32; water and loss, 2·08.

Red calcareous sandstone. Chemical analysis:—Silica, 49·4; carbonate of lime, 26·5; carbonate of magnesia, 16·1; iron alumina, 5·2; water and loss, 2·8. From quarries which have been in work for four hundred years.

These two sandstones are the connecting link between the magnesian limestone and the new red sandstone formations, partaking of the characters of both.

[The magnesian limestones, valuable for building purposes, are chiefly or entirely those which present equal proportions of carbonate of lime and carbonate of magnesia in a semi-crystalline state. Such stone has a peculiarly pearly lustre when broken, but its colour, when worked, is light yellowish brown, not changing by exposure. Its specific gravity is very high, the stone weighing upwards of 150 lbs. the cubic foot. The cohesive power is very great, and hardly rivalled by any limestone.—D. T. A.]

---

188 **STOCKS, MICHAEL**, *Shebden Hall, near Halifax*—Proprietor.

Specimens of ashlar building stone, from the Shebden-head quarries, near Halifax. The seam from which the specimens are obtained is between the lowest, or "Halifax beds," and the "Lowmoor beds" of coal; and between the lowest of the latter, or "better bed" coal, and the Northowram flag-stone. The Halifax beds of coal immediately overlie the millstone grit.

[The coal grits of Yorkshire supply a very good building material, well adapted for local purposes. Where there is not too large a proportion of organic impurities, the sandstones of the coal measures may often be depended on; but there is apt to be a want of cementing ingredients to bind the sand and gritty particles together.—D. T. A.]

---

189 **BELL, JOHN**, 25 *Buckingham Place, Fitzroy Square*—Designer and Manufacturer.

Specimen of oolitic limestone, from the Oreton Bank Works, Stottesden, Cleobury Mortimer, Shropshire.

Chiselled, sanded, grounded, and polished marble, adapted for columns, pedestals, &c.

---

190 **CLARK, GEORGE HOUSTOUN**, *Rotherhithe*—Agent.

Specimen of Devon Haytor granite, from the quarries of the Duke of Somerset, Haytor Rocks, South Devon. Blocks of the largest dimensions can be produced from these quarries. London Bridge, Fishmongers' Hall, the columns in George IV.'s Library, British Museum, part of Tothill Fields Prison, and the pillars to the gates of Christ's Hospital, are all of this granite.

Specimens of Bramley Fall stone, from the Fair Head quarries, Yorkshire, and from the quarries at Marshall Meadows, Berwick-on-Tweed.

Specimen of Spanish marble, polished.

190A **SMITH, CHARLES**—Producer.

Specimen of oolite limestone and blue granite.

---

191 **WILLIAMS, WILLIAM**, 1 *Wellington Street, Cardiff, Wales*—Proprietor.

Freestone from the Quarrella quarry, near Bridgend, Glamorganshire. It contains 99 per cent. of silica. Specific gravity, 2·288.

---

192 **SEYMOUR, ZECHARIAH**, *Street, near Glastonbury*—Producer.

Model of a flight of stone steps cut from the blue lias stone, and specimens of workmanship.

---

193 ——

Porphyritic granite from Wexford.

---

194 **JENNINGS, BENJAMIN**, *Hereford*—Proprietor.

Specimen of sandstone, from the Three Elms quarries, near Hereford. Exhibited on account of its strength and durability: it is said to stand equally well on its edge or on its bed; and to be suitable for cider-mills, sea-walls, railway purposes, &c.

195 **CUMMING, Rev. JOSEPH GEORGE**, *Castletown, Isle of Man*—Producer.

Black flagstone (Posidonia schist), from Poolvash, Isle of Man. Exported from Castletown. The quarries have been wrought upwards of 200 years. The steps of St. Paul's Cathedral are from these quarries: they were presented by Bishop Thomas Wilson. Used largely for flooring, chimney-pieces, tomb-stones, and, as suggested by the exhibitor, inlaid with a red composition to imitate encaustic tiles. Easily and economically wrought.

Grey marble (encrinital and shelly limestone), from Poolvash. Exported from Castletown. Used for tables and chimney ornaments.

Black marble (lower carboniferous limestone), from Port St. Mary, Isle of Man. It is hard and durable, and takes a good natural polish; raised in blocks and flags of great size. Used for piers, floorings, tomb-stones, and burnt into a strong lime.

Spanish-head flagstone (clay schist). It is exported from Port St. Mary, used for lintels and gate-posts, and in ancient times for Runic monuments, and is durable and slightly elastic in thin flags, and can be raised in squares of 16 feet each way.

Peel freestone (old red sandstone), from Craig Mallin, Isle of Man. Exported from Peel. A large portion of Peel Cathedral was built of it in 1226.

Granite, from South Barrule, Isle of Man. Quarries lately opened, and the church of St. John built from them. Old fonts on the island, were formed from boulders of this granite. Exported from Douglas, Peel, and Castletown.

Porphyritic greenstone, from Langness, Isle of Man. Good road material. May be obtained and shipped in any quantity at Derby haven.

Hæmatite. Iron ore from the glebe vein, Maughold, Isle of Man. Exported from Ramsey.

All the quarries on the island belong to the Crown.

[The different building and road materials, above referred to, will be found to present some rocks of considerable interest, hitherto little used for economic purposes. The marbles and other calcareous rocks are all from the carboniferous limestone, and entirely confined to the southern extremity of the island, near Castletown, where they occupy about 16 square miles, for the most part covered by tertiary gravel. The sandstones, schists, and granites are more abundant, but less valuable.

Of the calcareous rocks, the black flagstones of Poolvash contain much carbon and some argillaceous matter, and are very durable. The different marbles have the same properties as the carboniferous limestones of Derbyshire; and the porphyritic rocks are generally of good quality.—D. T. A.]

---

196 ——

Stones used at Liverpool for building purposes.

197 **POWELL, FREDERICK**, *Knaresborough, Yorkshire*—Collector.

Building stones, from quarries in the immediate vicinity of Knaresborough.

197A **RAYNES, LUPTON, & Co.**, *Liverpool*—Producers.

Specimen of limestone for lithographing from Pentregwyddel, near Abergale.

198 **CARNEGIE, W. F.**, *Lindsay, Kinblethmont, Arbroath*—Proprietor and Manufacturer.

Flagstones, rough and planed, from Leysmill Quarries, Forfarshire, and freestone from Border Quarries, the property of the exhibitor.

Flagstone, rough and planed, from Lord Panmure's quarries at Carmyllie, and freestone from Lochee Quarries, belonging to the Harbour Commissioners of Dundee, of which the harbour and dock are constructed.

Flagstone from Balgavies Quarries, belonging to Mr. Baxter, of Ellangowan. Flagstone, rough and planed, from Balmashanner Quarries, belonging to Mr. Watson Carnegy, of Lower.

Old red sandstone shale, or stone-clay, and brick and tile from the same, manufactured by the exhibitor.

Flagstone from Gaynd Quarries, belonging to Mr. Pierson.

All these flagstones are generally exported from Arbroath, and are known as "Arbroath Pavement."

199 LONG, W.—Producer.

Flags from County Clare.

---

200 HILL, J., C.E.—Producer.

Building material from Kilrush.

---

201 TAYLOR, JOHN, *Stamford*—Producer.

Marble, sandstones, slate, limestone, &c., all obtained within six or seven miles of Stamford.

---

202 POWELL, W. J., *Tisbury, near Hindon, Wilts*—Producer.

Varieties of hard and soft building stone, from Tisbury. The hard from Chicksgrove quarry, 20 feet below the surface, forming part of the Portland bed. The soft from Tuckermill quarry, 5 feet deep. The hard is used for steps, pavements, tablets, monuments, &c. The soft, for fronts of houses, cornices, and general building purposes. Both are adapted for resisting the influence of the weather.

A fish from the oolite formation at Tisbury.

Specimen of part of a fossil tree from Tisbury, found in an excellent state of preservation in the oolite formation.

---

203 DRIVER, WILLIAM, *4 Lyon's Inn, Strand*—Producer.

Specimens from the Chevin stone quarry, Otley, Yorkshire.

---

204 THE LESSEES OF THE STANHOPE LIMESTONE QUARRIES—Proprietors.

Polished specimens of the cockle strata in the carboniferous limestone; from Weardale in the county of Durham.

Specimen of the same in the rough state.

The lime manufactured from this stone is valuable as an agricultural manure. It is used as a flux in smelting iron ore; also for purifying gas; for tanning, and for other chemical purposes. The analysis is as follows, viz.:—

Carbonate of lime . .	95·1
Carbonate of magnesia	2·5
Earthy matter . . .	1·3
Residuum	1·1
	100·0

---

205 ——

Slab of sawn slate, from Glanmore, county Wicklow, Ireland.

206 SINCLAIR, J., *Forse, Thurso, Scotland*—Manufacturer.

Slab of paving stone, from Forse Rock Hill Quarries. (*See* Outside, No. 13.)

---

207 ROYAL DUBLIN SOCIETY—Producer.

Specimens of Valencia flags.

208 DAWBARN & Co.—Producers.

Manufactured slate.

209 STIRLING, THOMAS, jun., *Belvidere Road, Lambeth*—Designer, Inventor, and Manufacturer.

Slate cabinet, illustrating the applicability of slate to the formation of strong-rooms, powder-magazines, larders, venison-houses, partitions to rooms, water-closets, &c. The covering of the cabinet is formed by the bottom of a slate cistern, consisting of slabs of slate secured together in panels by a method invented by the exhibitor. The same method is also applicable to the covering of the roofs of mansions with slate.

Slate is adapted for use in fitting up the floors and compartments of public baths and wash-houses; and for stables, being applicable to mangers, stall divisions, linings, floors, and drains. It is also adapted for balconies, larders, wine-cellars, dairies, and various other purposes.

Articles exhibited in the cabinet, &c., and in general use:—

Patent self-acting filter on stand. Filter, which can be supplied by hand or made self-acting. Small slate cistern. Pickling trough. Samples of slate roll ridge; common saddle-back slate ridge. Sunk channel in slate. Solid slate sink. Slate sink constructed of five pieces. Washing-basin for water-closet, &c. Ornamental loo-table top. Sofa and side-table ornamental tops. Chess, or ladies' work-table tops. Inkstand. Water-closet supply box for slate cistern. Waste, union screw, and drawing off tap for slate cistern. Samples of various nails and screws used in slate work. Half of roof covered with Delabole slab slates. Specimen of Bangor slab slating.

Specimens of roofs covered with imperial slates from the Bangor quarries; rag slates from the old Delabole quarry; rag slates and green rag slates from Llanberis quarry; red duchess slates with three green slate diamonds; slates from Festiniog quarries, as cut by Mathews' patent cutting machine; open space new quarry duchess slates from Llanberis quarry; imperial slates from Aberdovey quarries, near Machynlleth.

Slate bed-room and dining-room chimney-pieces, from old Delabole quarries—in imitation of marble.

Carved head-stone; cut clock face.

[The collection of slates referred to in the above description is calculated to give an idea of the best qualities introduced into the London market, with the kind of use to which most of them are applied. chief localities are Cornwall (Delabole), Wales (Festiniog, Penrhyn, Llanberis, &c.), Lancashire, and Westmoreland. The Delabole is especially adapted for church and other roofs, and has been much used for this purpose.

The slates, lettered A, are from the great quarries at Penrhyn, and shipped at Bangor. These quarries have as many as 10 levels, and employ upwards of 2,000 persons. Those marked B, are from Llanberis; C, from the Dorothea Slate Company's quarries, near Carnarvon; D, E, from quarries at Festiniog, shipped at Port Madoc; F, G, from near Machynlleth, North Wales, shipped at Aberdovey; H, from Delabole, Cornwall, shipped at Padstow; I, K, L, M, from near Ulverstone, in Lancashire, including some of the Westmoreland quarries, and shipped at Ulverstone.

The present consumption of slate in London is to the extent of from 30,000 to 40,000 tons per annum. One third of this quantity is in slabs, and the rest in roofing-slates, which are in nine sizes, called respectively "ladies," "countesses" (3 sizes), "duchesses" (2 sizes), "queens," "rags," and "imperials." From "ladies" (16 inches by 8) to "duchesses" (24 by 12), the slates are sold per thousand (of 1,200 slates), but above that size by the ton. The "ladies" weigh 25 cwts. the 1,200 slates, and the "duchesses" 3 tons. The regular-sized slabs vary from 1 to 6 feet in length, and 1 to 3 feet in breadth. A large quantity of slate slabs is now used for ornamental purposes.—D. T. A.]

---

210 GREAVES, JOHN W., *Port Madoc, Carnarvon, Wales*—Proprietor.

Slabs and slates from the quarry at Festiniog, with tools used in manufacturing the same. Blue lias lime.

[Slate is extensively used in slabs for water cisterns and for covering roofs of slight inclination. For both these purposes it is jointed, and the joints are made with a cement, aided, as roof covering, by tongues in the joints [illegible] But the most extensive employment of slate is for roof covering, in the form known familiarly as *slates*. Slates are rent and dressed to sizes, and laid to lap and bond. Jointed slating is apt to fail from the expansion and contraction of the material, whilst lapped and bonded slating adapts itself to movement from changes of temperature or otherwise, without any derangement that can lead to failure.—W. H.]

211 **BREADALBANE, Marquis of,** *Taymouth, Aberfeldy, Perth*—Producer.

Slates from the quarries of Easdale, &c., in Argyllshire.

[The Easdale and other slate quarries of Argyllshire which have been worked for upwards of three centuries, employ about 200 men and boys, and export about 10,000,000 of slates annually, in about 300 vessels. The slates are not obtained generally in very large slabs, but most of the quarries supply a fair proportion of the larger kinds, used for roofing, and measuring 2 feet by 12 inches (Duchesses). They are worked in Easdale, Seil, and other small islands of clay slate, a little south of Oban, and near the large island of Jura. The quarries are of various dimensions; that of Ellenabeich being 300 feet long, 100 feet deep, and 150 feet broad, the quality improving in the depth. The other quarries are smaller; but those of Easdale are very valuable, and the quality excellent. The stratification of the beds of slate rocks is very much disturbed; but the cleavage is invariable, running N.E. and S.W., and dipping 50°.—D. T. A.]

212 **LIMERICK LOCAL COMMITTEE**—Producer.

Roofing slates. These slates are from the Imperial Company's quarries near Killaloe; and, from their great durability, they have been adopted for use by the Board of Ordnance in Ireland.

213 **GEORGE, J.,** *43 Edgware Road*—Inventor, Patentee, and Manufacturer.

Model of a dwelling-house: a method of building with wrought iron and slate slabs, glass, and other materials, intended to secure stability, durability, and freedom from damp and vermin, to save space, and improve temperature and ventilation.

Slate manger, with double swivel, to prevent crib-biting.

Fencing in slate and iron.

214 **OLD DELABOLE SLATE COMPANY (by JAS. CARTER),** *Camelford*—Proprietors.

Specimen of Davey's patent ridge slate.

Slate slab, used for flooring, landings, cisterns, &c.

Roofing slates.

[The magnificent quarries of Delabole have been opened for at least three centuries, and have supplied a large quantity of excellent slate. They are worked in the Devonian slates, near Tintagel, where they are chiefly shipped. The quality is good, combining lightness with strength, and resisting exposure perfectly.

This slate is used not only for roofing, but also in large slabs for various purposes.—D. T. A.]

215 **WILLIAMS, D.,** *Bangor*—Producer.

Patent slate ridges and hip, from Bangor, Wales.

217 **CADELL, HENRY,** *Dalkeith, Scotland*—Producer.

Coal from Dalkeith Colliery, as a specimen of the general coal-field of Midlothian, with section showing the strata in the coal-field at a depth of 523 fathoms.

[The Midlothian coal-field is not very distinctly bounded, but contains some kinds of coal much esteemed for household use. It is estimated that the district con-[illegible] in all, 24 distinct seams, having a total thickness of [illegible] feet of coal.—D. T. A.]

218 **PENNOCK, TIGAR, & CO.,** *Grove Hill Works, Beverley, and Hull*—Manufacturers.

Stucco paint to be used in oil or water. Beverley Cliff stone, or pure Paris white. Sulphate of barytes from Yorkshire stone. Prepared Yorkshire carbonate of barytes. Beverley Cliff-stone, or carbonate of lime. Yorkshire sulphate of barytes.

219 **HUNTER, L.**—Producer.

Model of a coal mine.

220 **LANGDALE, DAVID,** *Edinburgh*—Mining Engineer.

Six sections of the Scotch coal field, from the upper red sandstone, to the carboniferous limestone, with specimens of the coals and ironstones of Fifeshire and Ayrshire.

221 **BITUMINOUS SHALE COMPANY,** *145 Upper Thames Street, and Wareham, Dorset*—Manufacturer and Producer.

Specimen of bituminous shale, known as the Kimmeridge coal, obtained from the cliffs at Kimmeridge, in the isle of Purbeck, in the county of Dorset. The quarries were opened in August, 1849. It is a combination of bitumen with clay, and from it are obtained, by distillation, volatile mineral oil, grease; asphaltum, and manure—specimens of each of which are exhibited.

[Bituminous schists or shale are not confined to any peculiar geological or topographical limits, and are probably, in most cases, the result of the decomposition of large quantities of animal remains.

The Kimmeridge coal is of high specific gravity (1·319), of dark-brown colour, and without lustre; it effervesces slightly with acids, and burns readily with a yellowish, rather smoky, and heavy flame. It is a very local deposit.—D. T. A.]

222 **CAHILL, M.,** *Ballyconra House, County Kilkenny, Ireland*—Producer.

Peat charcoal, for deodorizing, mixing with manure, smelting, &c.; manufactured in Urlingford Bog, county Kilkenny.

223 **TURNER, SAMUEL,** *Orchard Place, East India Docks*—Manufacturer.

Coal, and products of its distillation.

Products from caoutchouc and from wood.

[A number of highly remarkable and peculiar substances arise from the distillation of coal, caoutchouc, and wood. Coal yields, in addition to illuminative gaseous products, various volatile oils, tar, ammonia in several forms, and a complex number of singular chemical substances in a state of vapour, or fluid. Caoutchouc yields a volatile oil in which it is itself soluble, and is largely distilled for the sake of this product, which is used in caoutchouc solutions and varnishes. Wood yields an inflammable fluid, called wood spirit, and an impure acetic acid, and tar.—R. E.]

224 **AZULAY, BONDY,** *Rotherhithe*—Producer.

Patent artificial fuel, made of coal dust by pressure, without the admixture of any other substance.

Coal-dust prepared for pressing.

Charcoal made of refuse tan, by extracting pyroligneous acid, tar, &c., from refuse matters.

[The immense compression obtained by the hydraulic press, has been employed in the arts for producing cohesion between loose particles of various substances. In the present instance, the same force is used to unite the separate particles of coal dust into a solid mass. A block of great density is the result of the pressure.—R. E.]

225 **OXLAND, ROBERT,** *Buckland Street, Plymouth*—Inventor and Manufacturer.

A series of specimens of Dartmoor peat, and the products obtained by its destructive distillation in cast-iron retorts. The top cut of the peat; the under cut; peat charcoal; pyroxylic spirit; chloroform made from it; peatine; heavy oil; paraffine; tar; acetate of lime; sulphate of ammonia; and solution of caoutchouc in peatine.

226 **LYON & CO.,** *Swansea*—Producers.

Two bricks of patent fuel.

227 **EVANS, GEORGE,** 6, *John Street, Adelphi*—Producer.

Specimens of peat, and its products, treated under Stone's patent processes, by the exhibitor.

Peats and Charpeats.

Localities whence Obtained.	Proprietors of the Lands.
Devonshire (Dartmoor).	H. R. H. the Prince of Wales.
Somersetshire.	—— Waring, Esq.
Lancashire.	Lord Burlington
Flintshire.	Sir John Hanmer.
Scotland.	Lord Willoughby de Eresby.
Ireland.	Colonel Chatterton.

Patent compound peat cokes, light and dense.

Patent compound fuel, anthracite and peat charcoal.

Ammoniacal liquor; watery product of the first distillation from peat.

Sulphate of ammonia; liquid ammonia; acetate of lime; and pyroligneous acid.

Paranaphthadipose; the general crude product of the first distillation from peat.

Peatole; the heavy oil from paranaphthadipose, first distillation; the same rectified.

Peatine, the peat from paranaphthadipose.

Peupione, the light fatty oil of peat obtained from peatole.

Adiposole, fatty part of the residue of the distillation of paranaphthadipose.

Peatpitch, pitch-like part of the residue of the distillation of paranaphthadipose.

Adipolein, residue after the distillation of peatole and peatine.

Peacerine; waxy residuum of re-distillation of adiposole.

Paraffine, product of the forced distillation of adiposole.

Bisulphuret of carbon, or spirit of sulphur, obtained from sulphur and charpeat.

Sulphuretted peat charcoal, after having served to carbonize the spirit of sulphur (fit for making gunpowder).

Humic acid. Peat umber, obtained from certain peats.

Panel of oak, graining with peat umber. Panel of rosewood, graining with peat ulmine.

Peat blue; peat-varnish; and peacerine heel-balls.

Huminate:—Stone's patent manures. Peat fire-lighters and revivers; peat plate powder.

Digesting and mixing churn used in the preparation of the oils, &c., with prospectus.

Specimen of black oak from the Flintshire Fen's moss; and of larch from the same. Laths rent from these.

Specimens of lichens and mosses (Sphagna, &c.) concerned in the formation of peat.

228 **COBBOLD, EDWARD,** 1 *High Street, Kensington*—Inventor and Producer.

Peat, condensed without pressure.

Various products obtained from peat.

[The method adopted by the present exhibitor to prepare peat for economic use as fuel is altogether different from that adopted generally. He mixes the peat with a large quantity of water, reducing it to an impalpable mud, and then, by getting rid of the water, obtains a compact mass of considerable density. The mechanical means adopted are simple, and take advantage of centrifugal force—the water being thrown off during rapid revolution.—D. T. A.]

229 **SEYSSEL ASPHALTE COMPANY**—Producer.

Raw material, and various products of asphalte.

230 **PATENT FUEL COMPANY,** 15 *St. Mary Axe*—Manufacturer.

Specimens of Warlich's patent fuel, consisting of the following series:—Welsh steam fuel, manufactured at Swansea; North country fuel, manufactured at Middlesborough-on-Tees; household fuel, manufactured at Deptford, from North country coal; and locomotive coke fuel, manufactured at Swansea; with samples of the tar and coal used in the manufacture.

[Warlich's patent fuel consists of bricks measuring 9 inches by 6½ and 5, and weighing about 12 lbs. They are dense and well made, require breaking before use, and when burning, give off little smoke, but they take some time to light. They contain carbon 90·02, hydrogen 5·56, sulphur 1·62, ash 2·91. They are made of the dust of various kinds of coal mixed up with bituminous matter, and partly charred. The above analysis has reference to those manufactured of Welsh coal.—D. T. A.]

231 **GREAT PEAT-WORKING COMPANY OF IRELAND,** *Offices,* 1 *Agar Street, Strand*—Producer.

Samples of their condensed peat, prepared by Gwynne and Hay's patent.

232 **PARSONS, J.,** 2 *Wharf, Eagle Wharf Road, New North Road*—Producer.

Two blocks of the patent fuel, and a number of fire revivers.

233 **FITZGERALD, REV. RICHARD,** *Clare Vein Tarbert, County Kerry, Ireland*—Producer.

Small specimen of peat in its natural state.

240 **ROGERS, JASPER W.,** 88 *St. James's Street*—Inventor and Patentee.

Peat-fuel and peat-charcoal, made from peat moss, or sphagnum, produced from the peat or turf bogs of Ireland (which extend over 3,000,000 acres): known in France as "tourbe." Peat-fuels.

Peat charcoal powder, for refiners and pyrotechnists, and for medical purposes.

Granulated peat charcoal, for sanitary uses, in deodorization, &c.

Peat charcoal manure, composed of equal parts of granulated peat charcoal and sewage matter.

Specimens of peat moss, taken from the bog of Allen, Ireland.

241 **ANSTED, D. T.,** Professor, *King's College, London*,—Proprietor.

Diagram of a group of coal plants.

242 **THE BIDEFORD ANTHRACITE MINING COMPANY. MAXWELL, JOHN GOODMAN,** Chairman, *Bideford, Devon*—Producer.

Anthracite coal, used for drying malt, lime-burning, &c.

Compressed fuel, moulded in blocks.

Mineral black paint, in powder, and mixed with oil or coal tar: mixed with the latter article, it is said to form a cheap, durable, and preservative varnish; applicable to shipping, out-buildings, &c.

[The Bideford anthracite occurs in certain rocks of the carboniferous system, occupying a considerable portion of the county of Devon, and generally called the culmiferous series. The beds have been worked for upwards of a century, producing a moderate quantity of coal; but the workings are not likely to be greatly extended. The thickness is very variable, averaging as much as seven feet, but sometimes diminishing to a few inches, and sometimes being 12 or 14 feet. To the depth of 8 or 10 fathoms it has been generally removed by old miners by means of adit levels, but shafts have been sunk more recently.

The pigment referred to is a variety of the anthracite, probably formed by decomposed parts of it, and has been much used.—D. T. A.]

243 **MALLET, ROBERT, C.E.**—Producer.

Anthracite coal from Castlecomer, Ireland.

244 **BAGOT, CHAS.**, 12 *Charlemont Place, Ireland*—Producer.

Specimen of turf, or peat. The products of turf are tar and a watery liquor; the former divisible into paraffine, heavy oil and light oil; the latter containing ammonia, carbonic acid, acetic and pyroligneous acid, and pyroxylic. The gaseous products are, carbonic acid, oxygen, hydrogen, and nitrogen. 100 tons of peat are said to give 10,000 gallons of liquor, 1,000 gallons of tar, 6,269 feet of inflam- The 1,000 gallons of liquor afford one ton of sulphate of ammonia, sufficient acetic acid to give 13 cwts. of grey acetate of lime, and 52 gallons of pyroxylic spirit. The tar yields 300 tons of paraffine, 200 gallons of light hydro-carbonaceous oil, and 100 gallons of more dense and heavy oil.

Anthracite, or stone coal, from the coal-fields of Kilkenny, county Tipperary, on the estate of Ambrose Goring, Esq., of Ballyphillip.

[The Kilkenny coal district includes a series of basins, or troughs, separated into three or four parts by carboniferous limestone. The strata are sandstones and shales, with fire-clay and several workable beds of anthracitic coal. The portion in the county of Tipperary extends for about 20 miles in length by 6 in breadth in the widest part. The beds are inclined at a high angle and undulate, the coal being worked by shafts to the centre or deepest part of the trough, and then upwards on both sides. There are only three beds in this district; two of them 2 feet each, and the other 9 inches. It is estimated by Sir R. Kane that 50,000 tons per annum are raised. The coal is considered to be of fair quality. It yields from 3 to 8 or 10 per cent. of red ash, and contains 9 or 10 per cent. of volatile matter.—D. T. A.]

245 ———

Specimen of bituminous coal from the Coal Island Mine, county Tyrone, Ireland.

246 ———

Specimen of Irish coal, iron, copper, and lead ores.

247 **BUTLER, JOSEPH LAWRENCE**, *Liverpool*—Proprietor.

Specimens of coal, cannel-coal, and coke, from different seams, worked by the Moss Hall Coal Company, at Ince, near Wigan.

248 **O'BYRNE, WILLIAM CHARLES**, 7 *Montague Street, Portman Square*—Proprietor.

Specimen of the exhibitor's Slievardagh coal.

[Slievardagh is in the county Tipperary, which contains a coal-field about 20 miles long, and 6 miles broad at the widest part; the coals lying in deep troughs, and consisting of three beds, one nine inches, and the others two feet deep. It was estimated by Sir R. Kane that 50,000 tons of coals per annum had been worked from this district up to the year 1845.—D. T. A.]

249 **RUSSELL, JAMES, & SON**, *Bathgate, Stirling*—Producers.

Specimen of cannel or gas coal, from Boghead, near Bathgate, Scotland, chiefly used for the production of gas, of which it yields 13,500 cubic feet per ton; the specific gravity being ·775.

Chips of this coal are found to be so inflammable that, being lighted at a taper, they burn like a piece of wood,

252 **WYLAM'S PATENT FUEL COMPANY**—Producer.

Patent fuel.

253 **POWELL, THOMAS**, *Gaer, near Newport, Monmouthshire*—Proprietor.

Specimen of Duffryn steam coal, raised at Aberdare in Glamorganshire, and exported at Cardiff; stated to be well adapted for steam marine purposes.

Specimen of bituminous coal from the Monythusloyne vein, raised at Lispentwyn, Monmouthshire; adapted for household and smithy purposes.

Model of the apparatus used for the shipment of coals from boats or waggons at Cardiff dock, worked by a high-pressure steam-engine, and enabling vessels to ship 400 tons per day.

[The great coal-field of South Wales, presenting nearly 1,000 square miles of productive coal area, and divided into an anthracitic and bituminous portion, yields also, and abundantly, that intermediate semi-bituminous variety, called steam-coal, of which the above and some others are well known, and adapted for general use in the Steam Navy. The Duffryn steam coal is rather soft, free-burning, burns cleanly, without smoke, does not cake, and leaves a little white ash. Its specific gravity is 1·326. It yields 84·3 per cent. of coke, and contains—carbon, 88·26; hydrogen, 4·66; nitrogen, 1·45; oxygen, 0·60; sulphur, 1·77; ash, 3·26. Its relative calorific value (carbon being unity) is 87·7.—D. T. A.]

254 **BUCKINGHAM, JAMES**, 13 *Judd Place East, New Road*—Producer and Importer.

Specimens of anthracite from J. P. M. Myers & Co.'s Bonville's Court Collieries near Tenby, Pembrokeshire, South Wales, which have been worked 25 years. This anthracite has a crystallized structure, ignites quickly, and requires no stoking; it makes no clinkers or smoke, and evaporates one-fifth more water than the best coke. It is uninjured by exposure to weather, having no pyrites.

A fuel is manufactured into blocks from the small coal (culm) of this anthracite, which burns readily without smoke, and gives great heat.

The anthracite is composed of—

Carbon	94·18	Sulphur	0·59
Hydrogen	2·99	Nitrogen	0·50
Oxygen	·76	Ash	0·98

Its specific gravity is 1·4119.

255 **BARROW, RICHARD**, *Staveley Works, near Chesterfield, Derbyshire.*

Coal, from the mines at Staveley, in the county of Derby, which belong to the Duke of Devonshire. This block of coal, 17 ft. 6 in. long, 6 ft. wide and 4 ft. thick, was raised from a shaft 459 feet deep. The coal is 6 ft. thick, and is valued for its cohesive strength and power of combustion, being in general use for steam-boats.

Three small pieces of coal, cut with a saw, from the same mine, intended to exhibit its utility as ballast, or for stowage in steam ships going long voyages. It is extensively used in the manufacture of iron.

[A gigantic specimen of this coal is placed outside the Exhibition Building. The southern part of the great central coal-field of South Yorkshire, and the adjoining counties of Derbyshire and Nottinghamshire, is now much worked, and contains several valuable beds of coal, and rapidly entering into general use. The pits are from 300 to 500 feet deep.—D. T. A.]

256 **JONES, SILLS, & CO.**, 55 *Bankside, Southwark*—Agents for the Proprietors.

A block and pieces of anthracite from the Gwaun Cae Gurwen Colliery, near Llanelly, South Wales; particularly adapted for use in kilns, in the manufacture of malt, and in drying corn. It is also adapted for use in close stoves, bakehouses, and wherever charcoal is used for heating or cooking, as it burns without smoke or soot. The seam from which the block is taken is 4 feet 6 inches thick.

259 LLANGENNECH COAL COMPANY, *Port of Llanelly, South Wales, & 6 Coal Exchange*—Producer.

Specimens of free-burning, smokeless, steam coal, from the Llangennech colliery.

[The Llangennech coal is dull, soft, and fibrous, with irregular fracture, burning to a red ash, and weighing nearly 57 lbs. to the cubic foot. It contains—carbon, 85·46; hydrogen, 4·20; nitrogen, 1·07; sulphur, 0·29; oxygen, 2·44; and ash, 6·54. Like other semi-bituminous coals, it burns without much smoke, and is therefore adapted for use in the Steam Navy.—D. T. A.]

260 WESTERN GASLIGHT COMPANY, 9 *Holles Street, Cavendish Square*—Producer.

Specimens of the Newcastle cannel coal, from which the gas supplied by the Western Gaslight Company to the building of the Great Exhibition is made.

Specimens of the cannel coke, produced in the manufacture.

261 ATKINSON, JOHN, *Coleford, Gloucester*—Producer.

A complete set of specimens of the workable seams of coal and veins of iron ore, from the Forest of Dean, placed in compartments, showing the name and thickness of each, and also the name of the works from which they are produced; with two sections of the mineral basin, illustrative of the same. The case which contains the minerals is a specimen of the oak of Dean Forest.

[The Forest of Dean coal-field is understood to occupy about 45 square miles; the total thickness of the deposits being about 3,000 feet, of which there is a thickness of 52 feet of coal distributed in 28 seams. It is remarkable for the great regularity of the deposits over a large part of the area, the beds dipping steadily towards the middle of the basin, and the millstone-grit rising and surrounding it. There is, however, an extensive and remarkable fault crossing the field. The workable seams of the district are in three groups, the lowest of which have not yet been much worked, except near their outcrop, where they are reached by levels driven from the hill side. Some parts of the thicker seams measure as much as 12 feet.—D. T. A.]

262 DAY & TWIBELL, *Barnsley*—Proprietors.

A column of coal, three feet square at the base, showing the entire thickness, and all the different qualities of the seams or beds which are found together, and generally known by the name of the Barnsley thick coal, from the Mount Osborne Collieries, Barnsley, Yorkshire. About two-thirds of the entire bed or stratum produce house-fire coal, and one-third, coal for steaming, iron-smelting, &c.

263 FIELD, COOPERS, & FAULDS, *Worsbro' Dale, Barnsley*—Proprietors.

Silkstone Main house coal, from the Silkstone bed—thickness of bed 5 feet 6 inches.

Worsbro' Park hard or steam coal, and soft or house coal, from the Barnsley 10-feet bed.

[The Barnsley coal is obtained from part of the great central coal-field of South Yorkshire, Nottingham, and Derbyshire, a district extending from Leeds to Nottingham, and including as much as 650,000 acres of coal-field. The qualities of coal obtained are bituminous or household coal, steam coal, cannel, and anthracite, varying much in quality in different localities. There are about 12 workable seams, the total average thickness being upwards of 30 feet, and the thickest seam is 10 feet. The total thickness of the upper carboniferous series here is estimated at about 550 yards. Much of the coal is worked on the long-wall method, and is of good quality.—D. T. A.]

264 FIRTH, BARBER, & Co., *Oaks Colliery, Barnsley*—Producers.

Coal for steam ships, for converting iron into steel, and for smelting iron.

Coal for domestic fires, from the Oaks Colliery, Barnsley, Yorkshire.

265 CORY, WILLIAM, & WILLIAM, jun., *Commercial Road*—Manufacturers.

London-burnt coke, for locomotive and foundery purposes.

[Coke is the fixed residuum obtained by burning coal in enclosed furnaces, and is generally obtained by the complete combustion of the volatile part of the coal, though large quantities are also produced by the economical distillation of coal in the manufacture of common gas. Coking on a large scale is performed in sets of ovens or furnaces of peculiar form, each charged every 48 hours with from 2 to 4 tons of fresh coal. The dome of the furnaces being heated (generally by the heat left since the previous coking), the coal is lighted from the top by a wisp of straw, all the doors and vents being open, and when in a state of combustion, the draught is so continued as to produce a gradual and slow combustion of the whole mass from above downwards, the gases being consumed. The calcination lasts about 40 hours, and the coal loses 20 to 25 per cent. of weight, but gains in about the same proportion in bulk. The texture of coke is peculiar, and determines its value.]

266 CLARKE, ROBERT COULDWELL, the Executors of, *Silkstone, near Barnsley*—Producers.

Coal, from the old Silkstone Colliery, near Barnsley, Yorkshire.

[The column of coal here exhibited is called peacock or iridescent coal, from the peculiar tints of colour which it shows, and which appear to be generally the result of some action of water on the surface and between the natural faces. This tarnish, rare in most collieries, appears to be particularly abundant in that from which the above specimens are taken. It is not quite clear whether it arises from a very thin film of foreign matter deposited on its surface, or whether the mechanical condition of the surface itself (as in the case of mother-of-pearl) produces the appearance of iridescence.—D. T. A.]

Models of corf, and set of tools, as used by colliers at work in the mines, and in raising coal from the pits.

267 NIXON, JOHN, & Co., *Cardiff*—Producers.

Merthyr and Cardiff steam coal, obtained from the Werfa colliery near Aberdare and Merthyr Tydvil. This coal is used for steam purposes, more especially for steam ships going long voyages. Its weight is 82·29 lbs. per cubic foot; its specific gravity 1·31. It is said to produce very little smoke. The following is the analysis of this coal as given in the Second Report of the Commissioners (Sir H. De la Beche and Dr. Lyon Playfair) appointed by Government to test the coals suited to the Steam Navy:—

Carbon	90·27
Hydrogen	4·12
Nitrogen, with traces of sulphur	1·83
Oxygen	2·53
Ash	1·25
	100·00

268 INCE HALL COAL & CANNEL COMPANY, *Wigan*—Proprietor.

Cannel coal, with various vases, manufactured of cannel coal. The cannel coal yields 11·673 feet of gas per ton, which is composed of—

Hydrogen	40·30
Light carburetted hydrogen	33·83
Carbonic acid	11·35
Olefiant gas and divers hydro-carbons	8·50
Atmospheric air	4·32
Carbonic oxide and aqueous vapour	1·53
Nitrogen	0·19
	100·02

Specific gravity of gas . . 6·20
Coke per ton produced 13 cwt. 18 lbs.

Specimens of the Arley and Pemberton coal, sent by the same exhibitors, will be found in the South Enclosure, beyond the western extremity of the Building.

[The Wigan coal-field is a portion of that known as the Lancashire and Cheshire, or Manchester, great coal-field, which ranges nearly fifty miles in length, with a breadth of ten miles on an average. The productive coal area is thus nearly 400,000 acres, and is divided into three principal portions, of which the middle one includes the thick coal seams; and these are worked in various places, Wigan being not the least important. The principal coals are a good caking coal (Arley main) and a very valuable bed of cannel; the former well adapted for domestic purposes, the latter yielding a large quantity of gas.

The total thickness of the carboniferous deposits is very considerable; but the number of seams of coal is large, and the thickness of many of them considerable.

The cannel is of fine quality, and takes a high polish, as seen in some of the specimens exhibited.—D. T. A.]

269 RAMSAY, G. H., *Derwent Haugh, Newcastle*—Inventor.

Cannel coal, with carved specimens.

Coke, and sample of coal from which it is made.

Samples of prepared manure, for different crops.

---

270 MITCHELL, Rev. W., A.M., *Woolwich*—Inventor and Manufacturer.

Specimen of coal, or bituminous mineral.

Vase, from the same. Pillars, with statues of Her Majesty and Prince Albert.

Box, for holding postage stamps. Stamp for sealing letters. Railway or sea chessboard and men. Snuff-box, as made from raw material. Snuff-boxes, polished. Box, with bracelets; another with backgammon men; and one with shirt buttons. Razor and knife hones.

The specimen of coal exhibited has recently been discovered near Edinburgh, and can be applied to the fine arts. It is of a brownish colour, and ignites with facility: it does not soil the hands: and it admits of a brilliant polish.

---

271 RUSSELL, JOHN, *Risca, near Newport, Monmouthshire*—Proprietor.

Specimen of black vein coal, raised at Risca, and exported at Newport: the vein ranges from 9 to 16 feet in thickness, and is worked by pits at a depth of 144 yards.

Specimen of Risca rock vein coal: the vein ranges from 4 to 5 feet in thickness, and is worked by pits at a depth of 100 yards.

Specimen of new black vein coal, raised at Cwm Tilery, and shipped at Newport; the vein is about 5 feet in thickness, and is worked by pits at a depth of 130 yards: this coal is stated to be well adapted for steam vessels.

Argillaceous iron ores from the lower coal measures of the South Welsh basin, raised at Risca.

Fire-bricks manufactured at Risca.

---

272 MORGAN, RICHARD, & SONS, *Llanelly, Wales*—Producers.

Stone-coal, or anthracite, from Cwm Amman, Llanelly, Gelly Ceidrim.

---

273 COAL TRADE OF NORTHUMBERLAND AND DURHAM, *Newcastle-upon-Tyne*—Producer.

Map of the coal-field of Durham and Northumberland, showing the pits and railways, with the faults and other remarkable interruptions.

Section of the coal-field, from and to given points, north and south; and a similar section from east to west.

Synopsis of the coal seams, in explanation of the map and section.

Working plan of a colliery, exhibiting the system of working and ventilating the coal mines.

Various specimens of household, coking, manufacturing, and cannel coal.

Specimens of coal from the carboniferous limestone formation of Northumberland.

Specimens of the strata and rocks of the coal formation.

Specimens of the strata and rocks of the carboniferous limestone formation.

Specimens of coke.

Safety lamps, used in the Durham and Northumberland collieries.

Drawings representing sections of Walbottle Colliery engine pit, in which the engines, pumps, &c., are shown.

[The Newcastle coal-field is estimated to contain upwards of 360,000 acres of productive coal area in the county of Durham, and nearly 150,000 in Northumberland. Of this 67,000 acres are now worked, and the average thickness of coal may be regarded as 12 feet. An acre contains 4,840 square yards, and each cubic yard of coal is estimated to weigh a ton; so that it may be considered that the coal-field has contained more than 10,000 millions of tons of coal, of which about one-eighth part is probably consumed, and the present annual consumption may be estimated at ten millions of tons, including the quantity destroyed and rendered unserviceable.

The maps and sections exhibited illustrate the condition of the district and the details of the coal-field. The qualities of coal are three: the common caking kinds, coarser kinds called splint coal, and cannel coal. They are all bituminous, but the proportions differ. The average quantity of gas from the caking coals is about 8,000 cubic feet per ton, the weight of coke being from 10 to 12 cwt.

The cannel coal has been much and profitably worked within the last few years, and yields a very much larger quantity of gas, amounting to 10,000 or 12,000 cubic feet the ton.

The coal is worked in the Newcastle coal-field at a very great depth, exceeding in some cases 1,800 feet; and the areas worked from one set of pits are often very large, amounting to 500 or even 1,000 acres. The associated beds of the coal measures are grits and shales; and there are many slips and faults, some of them very considerable.

The method of extracting the coal in the Newcastle coal-field is that called *pillar-and-stall*, which consists in first working a certain proportion of the coal by opening galleries at right angles to each other, leaving large pillars of coal to support the roof. These pillars are afterwards removed, and the roof allowed to sink down, forming what is technically called the *goaf*.

Owing to the large proportion of gas present in the coal, and the fact that such gas is given off readily from a newly-fractured surface, and on mixture with atmospheric air becomes highly explosive, it is necessary to take great care of the ventilation of the mines, and this more especially when the roof is partly fallen. The method of working has therefore reference to this, and the lights employed, where any danger is supposed to exist, must also be adapted to the peculiar condition of the mine. The models showing the mode of ventilation, and the structure of the ventilating furnace used to produce a strong current of air to circulate through the mine, together with the safety lamps (invented by the late Sir Humphry Davy), will illustrate these methods. The mechanical contrivances for drawing and screening the coals (separating the dust and small coal) are also very important in the economy of the district.

There are nearly 200 pits or collieries worked in the district: the number of men and boys employed is about 26,000; and the average price of the coal as shipped for London is not more than 11*s*. per ton. The estimated quantity of coal, sold in the year 1847, was about 7,730,000 tons.—D. T. A.]

---

274 **The Brymbo Company**, *Wrexham, Wales*—Producer.

Minerals, &c., found at Brymbo, near Wrexham, Denbighshire, or in the neighbourhood.

Main coal got at the Brymbo colliery.

[The Brymbo colliery is in a part of the Flintshire coal-field illustrated by the specimen of coal exhibited by Mr. Oakeley. There will be found a magnificent squared block of this coal in the enclosure beyond the western extremity of the Building.—D. T. A.]

275 **Randall, J.**, *Coalport, Salop*—Proprietor.

Minerals and their associated fossils, used in the manufacture of Shropshire iron. Also, specimens of clays, pottery, brick, tile, &c.

Cement from the curl-stone, manufactured by M. Brosely.

---

276 **Watney, Alfred**, *Llanelly, Wales*—Producer and Manufacturer.

Specimen of pure anthracite coal, raised from a pit at Gwendraeth, Llanelly, Carmarthenshire.

Two models of anthracite blast furnace (scale half-inch to one foot), situated at Gwendraeth, Llanelly, Carmarthenshire.

Pig-iron of excellent quality for foundery, tin-plate and boiler-plate purposes.

Furnace cinder or slag, classified according to the quality of iron made simultaneously with each.

Raw coal used in furnace; it burns without smoke, and bears the strongest heat without decrepitation.

Raw and calcined clay ironstone.

Limestone used as flux.

Sandstone used for lining hearths and boshes of furnace.

277 **Clive, J. W.**—Producer.

Raw and calcined specimens of a stratum of mineral substance found among the scaly iron ores of Clanway colliery, Tunstall, Staffordshire.

Thirty-five samples of ironstone, coal, &c.

---

300 **Huggis, Brothers**, *Gateshead-on-Tyne*—Manufacturers.

Samples of plaited ropes for mining purposes.

400 **Butterley Company**, *Alfreton*—Producer.

Specimens of coal and ironstone, and of organic remains in connexion with the Derbyshire coal-field, including analyses of the different coal strata.

Iron in its different stages of manufacture, including pig-iron, refined metal, puddled, and merchant bar-iron.

[The great central coal-field of England extends into Derbyshire, and the works at Alfreton and its vicinity have been long known as exhibiting in all no less than 30 seams of coal, whose aggregate thickness is 78 feet.

The iron ore associated with the coal in this district is of excellent quality, and very abundant.—D. T. A.]

401 **Baugh-Deeley & Co.**—Producers.

Iron chains used in coal mines.

Improved vice.

402 **Crutwell, Allies, & Co.**, *Cwm Celyn and Blaina Iron Works, Abergavenny*—Manufacturers.

Pieces of pig-iron, forge pig-iron, and refined metal; and cinder, or scoria, produced from them.

Puddled, merchant, and beat bar iron, with scoria.

Finished rail, showing fracture.

Specimen of sigillaria, from the lower coal measures, Cwm Celyn and Blaina Iron-works.

Rails connected, showing a new mode of fastening. The mode of riveting the rails to the chairs with lateral pins or rivets is the patent invention of H. D. Bird, Esq., of Petersburg, Virginia.

403 **Cawley, P.**, *Soho, near Birmingham*—Inventor.

Complete model and section of a Staffordshire coal-pit, with apparatus for preventing explosions in coal-mines, by exhausting the combustible gases, and supplying pure air in its place, and for enabling the workmen to ascertain in what state the air is, in the workings of the mine, before going down.

[The thick coal of Staffordshire is worked in a manner altogether different from that adopted either in Northumberland or Yorkshire, as there is constant danger of accident from the fall of the roof, besides that arising from the presence of gas which necessarily accumulates in large quantities in the upper recesses of the mine.

The usual mode of getting the coal is by sinking a pair of shafts at convenient distances, and extending a pair of levels from the shafts. On reaching the intended limit of working, the coal is removed on one or both sides of the levels, for a distance of about 20 yards wide; but pillars of 7 or 8 yards square are left at intervals for the support of the roof. Between each *side lane* of this kind a larger and more effectual barrier is left, 16 or 20 yards wide, and this is called a fire-rib, and serves not only to prevent a crush of the roof, but to allow of a dam being afterwards constructed to confine the gases. A large quantity of coal is left below by this process of mining, amounting sometimes to one-half or even two-thirds of the whole. The ventilation of the thick coal mines is generally imperfect, owing to the large body of air to be moved; but more accidents occur from falls of the roof than from explosions. The workings are generally left in the care of uneducated contractors called *butty colliers*.—D. T. A.]

404 **Brunton, W.**—Producer.

Model of a plan proposed for ventilating mines, with diagrams.

405 **HARRISON, AINSLIE, & Co.**, *Newland Furnace, Ulverston*—Producers.

Hæmatite iron ore, from Lindal Moor, in Furness, containing metallic iron, 66·47 per cent.; oxygen, 28·50 per cent.; silica, 3·43 per cent.; zinc, ·71; moisture and loss, ·89.

Charcoal pig-iron and furnace cinder, from Newland, Backbarrow, Duddon, and Lorn furnaces, said to be the only charcoal furnaces in Britain.

406 **FARNLEY COMPANY**—Producer.

Specimens of coal, coke, and iron-stone.

407 **DICKINSON, THOMAS FRIEND**, *Newcastle-upon-Tyne*—Producer.

Specimen of hæmatite, or kidney ore, exported from Balcarry Bay; used to mix with poorer iron-stone.

[These peroxides of iron vary in the quantities of iron they contain. Where they are crystalline they are usually found to consist—of iron, 70, and oxygen, 30. The uncrystallized varieties are generally not so rich, yielding oxygen, 30·66, and iron, 60·34. These ores afford a considerable portion of the iron manufactured in different countries; they are also, when ground, employed for polishing metals, and used as a colouring material.—R.H.]

408 **MOORE, JOSEPH, M.D.**, 10 *Saville Row*—Proprietor.

Iron ore, from the surface of the Arigna mines, on the western side of lake Allen, in the county of Roscommon. Calcined iron ore.

Limestone rock. Fire-clay, used for making bricks for kilns and furnaces. Fire-bricks, made from the same.

Moulding sand.

Specimens of coal found in the locality.

Peat turf, soft and hard. Charred peat for smelting.—Peat, called in Ireland turf, is used as fuel for domestic purposes; it may be used with advantage for smelting the iron ore, having all the effect of wood, and, when charred, of charcoal, which imparts to the iron the properties so highly prized in metal: prepared in wood furnaces.

Bar of iron, from the ore of Arigna. Bar of steel, converted from the same.

Crystallized rock, having a fine fracture, being the surface rock of the district.

Map of the works and section of the mine.

[The river Arigna divides the Connaught coal-field into two parts. The southern division consists of a great mountain ridge called Brahlieve, at the base of which are the Arigna iron-works. The rocks within this district are similar to those of other coal-fields, consisting of sandstone, shale, clay-ironstone, and fine fire-clay. The shale, which varies in thickness from 300 to 600 feet, rests on limestone rock, and is remarkable for its rich beds of ironstone.

Sir Robert Kane has given the following analysis of the clay-ironstone from Arigna:—

Protoxide of iron	54·42
Lime	2·23
Magnesia	2·02
Alumina	1·43
Clay	8·65
Carbonic acid	31·25

The mean of many analyses gives 40 per cent. of metallic iron, as the average produce of the iron ore of this district.

John Guest reported on the Arigna mines in 1804, and the cost of production to be as follows:—

	£.		d.
5 tons of raw coal at 6*s.* 4*d.*	1	11	8
4 ,, ironstone, at 6*s.*	1	4	0
1 ,, limestone	0	4	0
Labour	0	10	0
Rent and other charges	1	5	4
	£4	15	0

Mr. Griffith, in his report on the Connaught coal-field, estimates the cost of a ton of iron, produced in this locality, at only 3*l.* 2*s.* 5*d.* The real working cost appears, however, to be somewhat between the two. These statements are important, as directing attention to a very interesting iron-producing locality, which does not appear to have received the notice it merits.—R. H.]

409 **SCHNEIDER, HENRY WILLIAM**, *Ulverstone*—Producer and Manufacturer.

Red hæmatite iron ore.

Pig-iron, from Scotland, used therewith.

Bar-iron, made from the two combined.

Blister-steel, made from a mixture of iron ore and Scotch pig-iron.

Cast-steel, made direct from the iron ore and pig-iron, without being first converted into blister steel.

Shear steel, made direct from the iron ore and pig-iron, without being first converted into blister steel.

410 **SOLLY & Co.**, *Leabrook Iron and Steel Works, Tipton, Staffordshire*—Manufacturers.

Specimens of billet and bar-iron, made by the exhibitors.

Specimens of the finest wire, and of all kinds of steel made from the exhibitors' iron: as blistered, spring, double shear, and cast steel.

Specimens of saws, files, and a variety of other tools, and of fine cutlery, including a carriage-spring, all made from the steel manufactured from the exhibitors' iron.

411 **BIRD, WILLIAM, & Co.**, 5 *Martin's Lane, Cannon Street, City*—Proprietors.

Welsh pig-iron: cold blast, bright, mottled, and white pig-iron, and refined metal; from "Blaenavon" and "Coalbrook Vale" iron works. Anthracite, bright, mottled, and white pig-iron, and refined metal; from Ystalyfera and Yniscedwyn iron works.

Scotch pig-iron, from the Gartsherrie, Calder, Govan, and Forth Companies' iron works.

Bar-iron: common, best, and cable, marked GDP, made from Blaenavon pig-iron, and fractured, to show fibre and tenacity. The same made from Govan pig-iron. Staffordshire rounds, squares, flats, best and best scrap, boiler and sheet iron, BBH (crown) mark, with specimens of the fracture, and worked into different forms, to exhibit strength, tenacity, and quality, under various tests. A piece of chain, ⅝ inch diameter, proved to a strain of 19 tons. Staffordshire lion mark, made into chain and other forms. to show quality and great tenacity. Staffordshire bars in 10 feet lengths, from ½ inch to 6 inches diameter, as samples of JB & S (crown) mark. A bar 7 inches diameter, 20 feet 1 inch long, weighing 1 ton 2 cwt. 3 qrs. 12 lbs. of best best iron. Staffordshire iron, in various fancy forms, for sash, angle, and half-round iron. Scotch bar-iron, made into screws, nuts, nails, railway-spikes, and boiler-rivets.

Railway-bars: a piece of rail of the usual quality, from the Pentwyn iron works, near Pontypool, fractured under Nasmyth's patent steam hammer, to show the great strength and applicability of red short iron for rails. Sundry rail sections.

Tin-plate iron, made at Brockmoor, Staffordshire, from

Ystalyfera anthracite pig-iron, and exhibited in the different processes, from the puddled ball to the tin an terne-plate. The same in wire.

Tin-plates: tin and black-plates, made at Llanelly Glamorganshire, from Yniscedwyn anthracite pig-iron Tin and terne-plates, of various sizes and thicknesses, o the brand (crown). TD. Tin and black-plates from Lydbrook

Patent lap-welded boiler tubes, plain and enamelled of various lengths and dimensions, brass ferruled. tube 7 inches diameter, 13 feet 4¾ inches long. Corrugated enamelled roofing-plates, in colours. Tire bars, fractured.

The above-mentioned specimens are not manufacture for any special purpose, but are the fair average quality of each particular mark. These marks are well known t the trade, and are extensively used alike for home consumption as for export.

[The iron furnaces of the United Kingdom, in numbe about 450, of which 7 per cent. may be out of blast consume annually about 10,000,000 tons of coal, and 7,000,000 tons of ironstone, in order to make 2,400,00 tons of pig-iron, which is the estimated quantity for 1851 at an average cost of 48*s.* or 50*s.* per ton, taking al qualities, from No. 1 cold blast to No. 4 hot blast, in th range. The mill power (which can if necessary be extended) at present produces annually 1,000,000 tons o rails, bars, boiler-plates, hoop-iron, and the various descriptions of manufactured iron required for differen industrial productions, for export and home consumption. The home consumption is an average in weight o about 1½ cwt. per head for the population, and from the facility with which it is procured by every manufacturer in the United Kingdom, it affords the means of subsistence and profit to a larger amount of industrial hands than any other.]

412 **THE EBBW VALE COMPANY,** *near Abergavenny, and* 83 *Upper Thames Street*—Producer.

of coal and iron-stone, with foils, from th le iron-works, in Wales, and the Coalbrook Dale rks, in Shropshire.

showing the strata, vertically, of the South Wales hropshire mineral fields. Model of the mineral workings, taken both vertically and horizontally, of the Ebbw Vale estate. Working model of blast furnaces, showing the mode of using the gases and economising fuel. Pieces of various pattern rails, bar-iron, angle-iron, &c. Samples of rails, full length, and other descriptions.

[The South Welsh coal-field has been elsewhere described. The Coalbrook-dale field contains 32 square miles of workable coal, the average number of seams being 17, and the average thickness of the principal seams three feet. The field is much faulted, some of the dislocations amounting to 600 or 700 feet. The coal is of the kind called slate coal, and contains from 1 to 3 per cent. ash. The percentage of carbon is 56 to 64. Very excellent iron is made from several seams of clay-iron ore interstratified with the coal, and yielding upwards of three tons of ore per square yard.

The Ebbw Vale coal is brilliant, brittle, lights easily, and yields a clear fire. It is light, weighing 53¾ lbs. to the cube foot.

It contains 89·78 carbon; 5·15 hydrogen; 2·16 nitrogen; 1·02 sulphur; 0·39 oxygen, and 1·50 ash. The coal yielding the above analysis is that known as the "Ebbw Vale 4 feet steam coal." The mine is 400 to 500 feet deep.—D. T. A.]

413 **SUTCLIFFE, JOHN CLARKSON,** *Barnsley*—Producer.

Model of Honey Well Colliery, Barnsley, showing the manner in which it is worked and ventilated.

[The method of working coal, adopted in the Yorkshire mines generally, is that known as the *long wall*, and is distinguished from the Newcastle, or *pillar-and-stall* method, by extracting at once all available coal, instead of first taking a small proportion and leaving the rest in the form of pillars. The selection of the method of working should depend on the conditions of the mine; and generally the long-wall system may be considered admissible where ironstone occurs with the coal, the coal being thin or the floor and roof soft, the royalty small, the general superincumbent mass compact, and the water not very troublesome.

When, however, there is much gas, where the coal is deep and the quantity to be extracted from one set of workings very considerable, and the water troublesome, it cannot generally be recommended.

In working the long-wall method, it is usual to put a pair of levels from the shafts, and carry drifts at once to the extremity of the intended workings; and then, removing the coal from the end, the roof is allowed to fall, leaving only an air-way round the outside of the fallen mass (*gob*), cut in the solid coal. The gob is often partly filled with the rubbish removed in getting the coal.—D. T. A.]

413A **JAMES, JOHN,** *Blaina, near Abergavenny, Wales*—Inventor.

Model of a blast furnace for smelting iron ore.

["Smelting" is the process of reducing an ore to the state of a metal. The ore is first calcined or roasted by being burned with coal in the open air, until the water, sulphur, and carbonic acid are driven off; which, if not separated before going into the furnace, would injure the quality of the iron. The roasted ore, coke for burning, and limestone for a flux, are then thrown into the furnace, in the proportions of 14½ tons of coke, 16 of roasted ore, and 6¾ tons of limestone for every 7 tons of metal required. The "blast" is the stream of air thrown into the furnace by machinery, for promoting rapid combustion; the pipes conveying the "blast" are called the "tuyeres," and the ends from which the air issues are called the "nose pipes," or "nozzles." Some of the large Welsh furnaces contain 150 tons of ignited material, and 20,000 cubic feet of air are forced into them per minute.—S. C.]

414 **DICKINSON, J., F.G.S.,** *Inspector of Coal Mines, Birmingham*—Producer.

Section of the strata in the coal and ironstone mines at Dowlais and Merthyr Tidvil, South Wales.

415 **BEECROFT, BUTLER, & Co.,** *Leeds,* and 8 *Pancras Lane, London*—Manufacturers.

Pieces of best double-fagoted railway axles, in the forged state, cut to show the mode of manufacture; and broken, to show the fibre in fracture.

Pieces of best quality of railway tire-bar, in the forged state, cut to show the mode of manufacture; and broken, to show the fibre in fracture.

Railway tires, and double-fagoted railway axles, best quality, and double-fagoted cart and carriage axles, in forged state, bent cold in different forms, to exhibit the toughness, soundness, and strength of the material.

[As the speed of the locomotive steam-engine became developed, many results presented themselves which were as unlooked for by the mechanic and engineer as the speed itself had been wholly unexpected. Among these none has been the cause of more anxiety, and none perhaps of more real danger, than the change which wrought iron in axles and in the tires of wheels is found to undergo when exposed to the severe friction induced by rapid speed under heavy loads. Metal that had been deemed tough and fibrous became brittle, and broke like cast iron.

The specimens of railway tires and axles exhibited, in various conditions, and showing the structure of the metal in fracture, illustrate a method of obviating this result.—W. H.]

Double-worked cable-chain iron, bent cold.

Tension bar-end, of best Kirkstall iron, torn asunder by 135 tons, by means of hydraulic pressure.

Bar of iron in the rolled state.

Walking-sticks made from the iron.

Railway-carriage wheels of different materials and various construction.

Waggon and mail axles on various principles.

Improved Collinge's India and other axles.

Registered self-acting regulating damper for high-pressure boilers.

Registered improved moveable eccentric tumbler.

416 **Wingerworth Iron Co.**, *Chesterfield, Derbyshire*—Manufacturer.

Iron ore and pig iron. Specimens of castings; wrought iron and steel made from the same.

417 **Biddulph, John**, *Cwm Avon Works, Taibach, Glamorganshire*—Manufacturer.

Bar iron, sheet iron, tin plates, naphtha, and minerals.

418 **Mills, Robert**, *Foxhole Colliery, near Swansea*—Inventor.

Model of an apparatus for opening and closing doors in mines, by a reversion of levers, one opening, and the other closing the door, on each side of the door; whether worked by the carriage drawn by a horse, or pushed by a man or a boy, the action is precisely the same. The principal advantage is to keep the doors regularly closed; the doors being at present attended to by boys, who are apt to fall asleep, leaving the doors open, and allowing the air to make its escape to the upcast pit; thus leaving the working part of the pit unventilated, and in many cases causes serious accidents. The Foxhole Colliery, where this method is in practice, has been worked from 80 to 100 years; and there has not been an explosion of gas in it for the last 22 years.

419 **Thomas, John Trotter**, *Coleford*—Producer.

Specimens of iron ores, from the Forest of Dean.

---

420 **Ulverston Mining Company**, *Stainton*—Producer.

Furness iron ore (hæmatite) produced from mines belonging to the Earl of Burlington, and used in Staffordshire, Yorkshire, and South Wales, for mixing with inferior iron ores.

---

421 **Montague, Arthur**, *Lydney, Gloucestershire*—Proprietor.

Specimens of the iron ore procured from the mines of the Forest of Dean Iron Company, and smelted at their iron works at Parkend, Gloucestershire, with the pig-iron, refined metal, and furnace scoria produced from it, viz.:—

Argillaceous, calcareous, and silicious hæmatite iron-ore. Best forge pig-iron. Refined metal. Blast furnace scoria.

422 **Ainsworth, Thomas**, *Cleator, near Whitehaven*—Proprietor and Manufacturer.

Iron ore (*Hæmatite*) from mines in Cleator. No. 1. Pig iron from hæmatite ore only.

423 **Bewick, Joseph**, *Grosmont, near Whitby*—Producer and Agent.

Calcareous ironstone from the iron mines of Mrs. Clark, of Hollins House, Grosmont, in the valley of the Esk.

Sandstone from the estate of Mrs. Clark, at Fairhead, near Grosmont.

Petrified shells found in the ironstone beds.

424 **Bickford, Smith, & Davey**, *Tuckingmill, Cornwall*—Inventors and Manufacturers.

Several kinds of safety fuse, adapted to convey fire to the charge in the blasting of rocks or of ice, or in submarine operations. The fuse consists of a small column of gunpowder, spun into the centre of a cord. The different kinds are made by adapting the coating to resist the pressure of water. Gunpowder not being allowed in the Exhibition, these samples are made with sand.

[The safety fuse is considered to possess three great advantages over the ordinary mode of firing a charge: first, that of certainty both as to time and resistance to damp; second, that of safety; and thirdly, that of economy.—D. T. A.]

425 **Page, J. R.**, *Athenæum Club*—Proprietor.

Specimens of ironstone, from the Leitrim coal and iron basin. Also some specimens of the same in a washed state.

Small pieces of the iron, from the same, reduced by means of peat charcoal.

426 **Monkland Iron and Steel Company** (**William Murray**, 33 *West George Street, Glasgow*)—Producer.

Specimens of the seams of coal, ironstone, limestone, freestone, fire-clay, and Roman cement, contained in the various strata of the mineral field of Lanarkshire.

Specimens showing the relative quantities of coal, raw and roasted ironstone, pig iron, refined iron, and puddled iron, required to produce malleable iron.

Specimens of white pig iron and malleable iron, square, round, flat and half round; rails, wheel-tires, angle iron, and nail-rods.

[The coal-field of Lanarkshire comprehends about 150 square miles in that county, and contains from 20 to 30 seams of coal, of which five or six are generally worked in one colliery, having an aggregate thickness of about 20 feet. None of the coals are caking, and one kind (the columnar glance coal) burns without flame or smoke.

About half the coal raised is used in the iron-works. The total consumption in 1845 was upwards of two millions of tons.—D. T. A.]

427 **Blackwell, S. H.**, *Dudley*—Producer.

A series of iron ores, illustrating the general iron-making resources of the United Kingdom. The following remarks have reference to this series:—

The gross annual production of iron in Great Britain is now upwards of 2,250,000 tons. Of this quantity South Wales furnishes 700,000 tons; South Staffordshire (including Worcestershire) 600,000 tons; and Scotland 600,000 tons. The remainder is divided amongst the various smaller districts.

One of the principal causes of the advantages possessed by Great Britain in the manufacture of iron, arises from the number and variety of the measures of argillaceous and black-band ironstones which alternate with the beds of coal in almost all its coal-fields; and in consequence of which, the same localities, and, in many instances, the same mineral workings, frequently furnish both the ore and the fuel required to smelt it.

So extensive are the ironstone beds of the coal measures, that they furnish in themselves the greater part of the iron produced in Great Britain; but the iron-making resources of the kingdom are by no means confined to them. The carboniferous, or mountain limestones of Lancashire, Cumberland, Durham, the Forest of Dean, Derbyshire, Somersetshire, and South Wales, all furnish important beds and veins of hæmatite; those of Ulverston, Whitehaven, and the Forest of Dean are the most extensively worked, and seem to be almost exhaustless. The brown hæmatites and white carbonates of Alston Moor and Weardale also exist in such large masses that they must ultimately become of great importance. In the older rocks of Devon and Cornwall are found many important veins of black hæmatite, and in the granite of Dartmoor numerous veins of magnetic oxide and specular iron ore. The new red sandstone furnishes in its lowest measures beds of hæmatitic conglomerate. In the lias and oolites are important beds of argillaceous ironstones, now becoming extensively worked; and the iron ores of the greensand of Sussex, once the seat of a considerable manufacture of iron, will, in all probability, again soon become available, by means of the facilities of railway communication.

In the following classification, the number of the blast furnaces in each district is given, and the ironstones of the coal measures are arranged in the definite order in which they occur in the different coal-fields; so that their position, in reference to the beds of coal alternating with them, is at once seen. The more important of the coal-fields are also subdivided into districts, showing the changes which occur in each, and thus giving a concise view of their general character. The other iron ores are arranged according to the geological formations in which they occur.

The produce of the manufacture of iron in Great Britain in 1750 was only about 30,000 tons; in 1800, it had increased to 180,000 tons; in 1825, to 600,000 tons; in the following year the duties upon the introduction of foreign iron were either removed or rendered nominal, since which the production of iron has nearly quadrupled itself, being now about 2,250,000 tons.

		Small Gribbur Coal	2	9

The iron ore principally used at the Pentyrch works is hæmatite, from the carboniferous limestone on the south of the South Welsh coal-field. The annual production of iron on the south outcrop is about 25,000 tons.

SOUTH WALES.—(Upper or Red Ash Series.)

126*n* to 126*b*.	..	*Blackband; Jos. Latch, & Co.*—Colfatch Colliery, Gellygaer, Glamorganshire. This Blackband lies in four courses, respectively 22, 6, 8, and 6 inches thick. Total thickness, 3 feet 6 inches. It lies in [illegible]6 feet of ground, and yields upwards of [illegible]7,000 tons per acre. Its position is very high in the coal measures above the Mynyddis-mwyn Vein of coal.		

The South Wales Coal-field extends over an area of upwards of 800 miles. Both from its extent and the varied character of its numerous beds of coal and iron, it may be considered as the most important of all our coal-fields. The upper measures furnish the best Red Ash coals for household purposes, whilst its lower measures are well adapted for iron-smelting, and for steam coal.

The number of furnaces now in blast is 143, averaging about 100 tons of iron each per week: or a gross annual production of 700,000 tons, and requiring 2,000,000 tons of ironstone, principally furnished from this coal-field. The annual production of coal is estimated at from 5 to 6,000,000 tons.

In 1796, the annual production of iron in South Wales was 34,011 tons, and in 1823, 182,325 tons; since which time the production has been nearly trebled.

In the eastern part of the district the coals are bituminous; as they approach the west they gradually become semi-anthracitic; and in the western district all the coals are anthracitic.

From the great area of this coal-field, and the great variety in character, both of its beds of coal, and its measures of ironstone and blackband, it will, in all probability, long remain the most important iron-making district in the world.

NORTH WALES.

139	5	*Lower Yard Coal Ironstone, Rhuabon.*		
		Lower Yard Coal . .	3	0
40—145	6	*Wall and Bench Ironstones, Rhuabon.*—6 courses = 12¼ inches (No. 12 to No. 17), lying in about 7 feet of ground.		
		Wall and Bench Coals .	3	0
46—160	7	*Llwynemion Ironstones, Rhuabon.* — 15 courses (No. 18 to No. 32), averaging 30 inches, all worked with the coal in three lifts. Will yield 8,000 to 9,000 tons per acre.		
		Llwynemion Coal . .	1	6

The production of iron in this district is very limited: the coals are principally thin, but good in quality: and the ironstones, although lean, furnish very good iron. The only important works now in blast are the Rhuabon and the Brymbo. The Brymbo series appear by themselves.

Annual production of iron about 90,000 tons. This field was one of the first important iron-making districts of the kingdom; but from its limited extent, the production of iron in it has remained, for a considerable period, nearly stationary. The quality which it produces is very good. The coal measures of Shropshire were probably once connected with those of South Staffordshire—indeed, of the identity of some of the measures in the two districts there can be little doubt. This is especially evident in the Whitestone and Cakes of the one, and the Pennystone of the other; and a great resemblance between all the measures of the two fields may also be traced, the difference in their thickness, &c., not being greater than might be expected at such distant points, judging from actual changes that are known to occur in some of the South Staffordshire beds, over comparatively a small space of ground.

200, 201	10	*Fire Clay Balls, Dudley.*		
		Bottom Coal	2	0

The Dudley Division of the South Staffordshire and Worcestershire coal-field is principally celebrated for the Ten Yard, or Thick Coal, so named from its being 30 feet thick, and which may well be termed, *par excellence,* "The Thick Coal." This is the largest and most important bed of coal in the kingdom, and is of excellent quality, both for household purposes and for the manufacture of iron. When undisturbed by faults, and of average quality, this bed of coal, with the associated thin coals and ironstones, is worth at least 1,000*l.* per acre. The quality of iron made is very superior. It was in this district that coal was first used, in the year 1619, for the purpose of smelting iron.

The Gubbin and White Ironstones are the principal ironstones of this district. The Gubbin measures will average about 1,500 tons per acre; the White Ironstone varies much both in quantity and richness. It yields from 1,000 to, occasionally, 3,000 tons per acre; 1,500 tons may be taken as about the average.

		WOLVERHAMPTON DISTRICT.	Ft.	In.
		Sulphur Coal . . .	2	0
		New Mine Coal . .	6	6
		Fire Clay Coal . .	9	0
202, 203	1	*Poor Robin's, Bunker's Hill.*		
204	2	*Fire Clay Balls, Bunker's Hill.*		
205	3	*Rough Hill White, Darlaston.*		
		Bottom Coal . . .	10	0
206, 207	4	*Gubbin and Balls, Bunker's Hill.*		
		Mealy Grey Coal . .	2	3
208, 209	5	*Blue Flats, Bunker's Hill.*		
210, 211	6	*Bristol Diamonds, Darlaston.*		

The space of ground occupied by the above measures from the Sulphur Coal to the Bristol Diamonds is about 90 yards. These measures occupy a position in the general coal series, below the Thick Coal of the Dudley District; and attain in the Wolverhampton Field a much greater thickness and importance than at Dudley, where scarcely any of the above measures of coal and ironstone prove workable. The ironstones are all of extremely good quality, averaging from 30 to 35 per cent. From the low cost at which they are generally raised, the number and variety of the measures both of coal and ironstone contained in so small a space of ground, and the superior quality of the iron produced, the Wolverhampton Division of the South Staffordshire coal-field may be considered as one of the most important, in proportion to its area, of any of our iron-making districts.

		BENTLEY AND BIRCH HILLS DISTRICT.
212, 213	1	*Brown Stone, Bloxwich.*—This is the only measure of Blackband in the South Staffordshire Coal-field. It lies underneath the lowest Heathen Coal, in two courses averaging about 12 inches, and does not prove south of Bentley. The other measures of this district do not vary greatly from those of Wolverhampton.

The annual production of iron in South Staffordshire and Worcestershire is nearly 600,000 tons. It is considered to be the second most important iron-making district in the kingdom; for although the production of pig-iron in Scotland is equal to that of this district, yet it far surpasses Scotland in the manufacture of wrought-iron; whilst the superior quality produced also gives it pre-eminence over that of Wales.

		Coventry and Bedworth Coal Field.
214, 215	1	*Bedworth Balls, Bedworth.*—Two courses, forming an exceedingly good and important measure of Ironstone, raised extensively for transport to the South Staffordshire Coal-field.

		Series from Shelton Colliery, Hanley.		
230to236	1 to 7	*Red Shag Ironstone. Gutter Mine. Bassey Mine. Penny Stone. Deep Mine. Chalky Mine. Gubbin Stone.*		
		Series from Apedale, near Newcastle.		
237to2[illegible]	1 to 13	*Blackband Ironstone*—4 to 5 feet thick. *Red Shag*—6 feet thick. *Red Mine*—9 feet thick. *Bassey Mine*—7 feet thick. *Cannel Mine. Black Mine. Rusty Mine. Chalky Mine. Little Mine. New Mine. Brown Mine. Thickband. Gold Mine.*		

These last two series are not numbered according to their position in the coal measures. Many of them belong to the same measures as those of the Foley Colliery, Longton, although named differently.

The North Staffordshire coal-field, although not of great importance *directly*, as an iron-making district, its annual produce being only about 55,000 tons, is yet of great importance from the amazing extent of ironstone which it contains, and the large quantities sent thence to the South Staffordshire, and the North Welsh iron districts. No other known coal-field contains anything like an equal number and extent of ironstone measures. From the Bassey Mine to the Knowles Mine, a series of measures at the Foley Colliery, Longton, of only 250 yards in thickness, there are nine distinct workable measures of ironstone. At Apedale, the Blackband, Red-shag, Bassey Mine, and Red Mine, ironstones, are respectively 4, 6, 7, and 9 feet thick. In consequence of so large a proportion of the cheapest worked ironstone measures being Blackband or carbonaceous, and also from the inferior quality of its coals, the iron of this district is inferior. The thickness of the coal measures already known, is upwards of 1,100 yards, containing 32 seams of coal, varying in thickness from 5 inches to 8 feet. Of these, there are 14 beds below the Little Mine coal, all of which, excepting one, are from 2 to 7 feet thick.

Annual production of iron about 60,000 tons. Average thickness of coal measures, from magnesian limestone to Kilburne, or lowest worked coal, 600 yards. Many of the beds of ironstone lie in such a thickness of measure as only to be workable to advantage by open work or bell-pits. Where these means of working can be adopted, the produce per acre is oftentimes very large; in the Honeycroft Rake it is 6,000 tons per acre; in the Black Shale 8,000 tons.

405	1	*Blackband, Hedley, Northumberland.*		
406, 407	2	*Blackband, Haydon Bridge.*—This bed probably occupies the position of one of the beds of coal underneath the Great Limestone, and forms an interesting instance of the manner in which thin beds of Coal sometimes change into beds of Blackband Ironstone. It averages, probably, three feet in thickness.		
408—410	3	*Ballstone, Haltwhistle, Northumberland.*		
411, 412	4	*Ballstone, Nent Head, Cumberland.*—These measures (Nos. 3 and 4) lie in the Plate bed over the Great Limestone, and in about 5 yards of ground; they have been worked extensively on some parts of the out-crop. Average yield 30 to 35 per cent.		

NORTHUMBERLAND, CUMBERLAND, and DURHAM—*continued.*

General No.	*No. of Series.*	—	Ft.	In.
413	5	*Brown Hæmatite, Kilhope Fell, near Nent Head.*—This bed corresponds with the Fell Top Limestone bed of this district; which in this locality is converted into a bed of Brown Hæmatite, probably owing to its being intersected by a considerable number of small veins carrying iron "riders." It is from 3 to 7 feet thick, and of good quality.		
414, 415	6	*Brown Hæmatite, Nent Head.*—This bed corresponds with the little limestone bed of this district. It is about 7 feet thick, quality very variable.		
416, 417	7	*Brown Hæmatite, Silly Hole Vein, Alston.*		
418	8	*Brown Hæmatite, Manor House Vein, Alston.*		
419	9	*Brown Hæmatite, Nest Vein, Alston.*		
420	10	*Brown Hæmatite, Stanhope, Durham.*		
421	11	*Brown Hæmatite, St. John's Chapel, near Stanhope.*		
422	12	*Carbonate of Iron, Stanhope.*		
423	13	*Carbonate of Iron, Alston.*		

Annual production of iron about 90,000 tons. The iron works of this district are gradually increasing in importance, the cost of fuel being so low as to permit ores to be brought from many different localities. The black bands of Scotland and of Haydon Bridge, the brown hæmatites and white carbonates of Alston and Weardale, and the argillaceous ironstones of the lias of Whitby and Middlesborough, are all used for the supply of the iron-works of this district.

The *brown hæmatites* deserve especial attention. They are found associated in very large masses, with the lead veins of this district, and occasionally they occur as distinct and regular beds. They contain from 20 to 40 per cent. of iron. Sometimes they exist as "riders" to the vein, sometimes they form its entire mass, and, in this case, they occasionally attain a thickness of 20, 30, and even 50 yards. Their employment for iron-making purposes is only recent; but the supply of ore which they can furnish is almost unlimited, and when some better means of separating the zinc and lead associated with them shall have been discovered, they will, doubtless, be found to be of great importance. Remarkable changes sometimes occur in the character of the metalliferous veins of this district; the same vein which at one point bears principally lead ore, changing to a calamine vein, and then again to brown hæmatite.

LANCASHIRE and WEST CUMBERLAND.

General No.	*No. of Series.*	—	*Blast Furnaces.*	
		Principal Works:—	In	Out
		Cleator Iron Company . .	3	0
		3 Furnaces		
424–429	1–6	*Hæmatite, Cleator Iron Ore Co., near Whitehaven.*	Ft.	In.
430 431 432	7 8 9	*Hæmatite, Harrison, Ainslie & Co., Ulverstone.*—Clay ore lying close to surface.		

The production of iron in this district is very limited, being confined to the Cleator works, and one or two small charcoal works in the Ulverstone district. The quality of the latter, charcoal being used for fuel, is very superior, and the produce commands the highest prices, as it combines, with the fluidity of cast-iron, a certain malleability, especially after careful annealing. The iron of the Cleator Works is smelted with coal, and though, in consequence, not equal to the other, is yet of superior quality. The ore, both of the Whitehaven and the Ulverstone and Furness districts, is raised most extensively for shipment to the iron works of Yorkshire, Staffordshire, and North and South Wales. In quality, these ores may be considered as the finest in this kingdom, and the supplies which these districts are calculated to produce are very great. The large percentage of iron which they contain, from 60 to 65 per cent., and their superior quality, also enable them to bear the cost of transport, and they are becoming every day of greater importance. They are found, both as veins traversing the beds of the mountain limestone formation, transversely to the lines of stratification, and also as beds more or less regular. The former is the general character of the Ulverstone and Furness ores, no clearly defined bed being, as yet, known in that district, whilst at Whitehaven there are two, if not more beds of irregular thickness, but with clearly defined floors and roofs, and oftentimes subdivided by regular partings. These beds attain a considerable thickness, occasionally 20 or 30 feet. The area over which they extend is not as yet well known; but they have been worked extensively for many years, and the workings upon them are rapidly increasing. They lie beneath and close to the coal measures, which both furnishes the necessary fuel, and also important beds of argillaceous ironstones for admixture.

FOREST OF DEAN.

General No.	No. of Series.	—	Blast Furnaces.	
—	—		In	Out
		PRINCIPAL WORKS:—		
		Cinderford	3	.
		Forest of Dean Company . .	2	.
		5 Furnaces	5	.
			Ft.	In.
433–438	1 6	*Hæmatite.*		

Annual production of iron about 30,000 tons. The ores of the Forest of Dean are carboniferous, or mountain limestone ores, lying beneath the coal measures, which are not here productive in argillaceous ironstones as in the other principal coal-fields of the kingdom. Besides the limestone ore, there is a bed of ore in the millstone grit measures; but which is only worked very locally. The limestone ore occupies a regular position in the limestone measures, although in itself exceedingly irregular, assuming rather the character of a series of chambers than a regular bed. These chambers are sometimes of great extent, and contain many thousand tons of ore, which is generally raised at an exceedingly low cost, no timbering or other supports for the roof being required. The supply of ore producible in the Forest of Dean is almost unlimited. The iron made from it is of a red short nature, and especially celebrated for the manufacture of tin plates. Its superior quality always commands a high price. This ore is raised extensively for shipment to the iron-works of South Wales. It was worked at a very ancient date either by the Romans or the Britons, as is evident from the remains of old workings along the outcrop of the ore bed. This ore averages from 30 to 40 per cent.

General No.	No. of Series.	—	Ft.	In.
—	—	*Geological Formation: Granite and the Older Rocks.*		
439	1	*Compact Micaceous Iron Ore, Hennock, Devon.*—Found in lodes varying from 1 to 12 feet wide, bearing east and west. These lodes are in coarse grained porphyritic granite. The ore is associated with Quartz, Clay, Schorl, and Hornblende. It contains 60 per cent.		
440	2	*Soft Micaceous Iron Ore, Hennock.*—Found associated with No. 1.		
441	3	*Magnetic Oxide, Haytor, Devon.*—Found inter-stratified with a compact Felspathic and Hornblende Slate. It is associated with Asbestos, Actynolite, Garnet, Opal, Quartz, and Clay. It contains 70 per cent.		
442	4	*Compact Brown Iron Ore, Bishopsteignton, Devon.*—Found in irregular masses, in Limestone. It contains 60 per cent.		
443	5	*Compact and Crystallised Brown Iron Ore, Brixham, Devon.*—Found in irregular masses, in Limestone. It contains 55 per cent.		
444	6	*Red Hæmatite, Sheviock, Cornwall.*—Found in lodes in Clay Slate.		
445	7	*Brown Hæmatite, Sheviock, Cornwall.*		

The micaceous iron ores and the magnetic oxides of Dartmoor (Hennock, &c.) are only just beginning to be known. The quality of iron which they produce is of a superior description, and is calculated to make the finest steel. These ores are not at present raised extensively; but will doubtless become more so when their character is better known, and the localities in which they are found more thoroughly explored. They are sent principally to the South Wales Iron District.

General No.	No. of Series	—	Ft.	In.
—	—	*Geological Formation. Granite and the Older Rocks.*		
446 447 448	1 2 3	*Pysolitic Iron Ore, Tremadoc, Caernarvonshire.*		

These iron ores have, at different periods, been worked to a considerable extent for transport to South Wales. They are of inferior quality; but the large masses in which they lie, enable them to be raised at a very trifling expense. They are found at Tremadoc, Pwllheli, Carnarvon, Island of Anglesea, and many other localities round the North Welsh coast; and will doubtless at some period, prove of importance, from the great extent to which they are there developed.

General No.	No. of Series.	—	Ft.	In.
—	—	*Geological Formation. Grauwacke.*		
449	1	*Hæmatite, Brendon Hills, Somersetshire.*		
450	2	*Soft Hæmatite, Brendon Hills, Somersetshire.*—Found in lodes varying from 1 to 6 feet in thickness, in Grauwacke and Gray Slate. These lodes are not at present worked extensively; but they form the site of very old and extensive workings, probably by the Ancient Britons.		
		Geological Formation. New Red Sandstone.		
451	1	*Fine Hæmatitic Conglomerate, Newent, Gloucestershire.*		
452	2	*Hæmatitic Conglomerate, Newent, Gloucestershire.*		
453	3	*Hæmatitic Conglomerate, Brockwell, near Wotton Courtney, Somersetshire.*		
454	4	*Hæmatitic Conglomerate, Brockwell.*		
455	5	*Hæmatitic Conglomerate, Frampton Cotterell, Somersetshire.*		
456	6	*Hæmatitic Conglomerate, Cowbridge, South Wales.*		

These hæmatitic conglomerates are found at the base of the New Red Sandstone, and generally occupy the position of its lowest bed. Their character as working ores is very variable, being sometimes mixed up with so much extraneous material as almost to be worthless; but occasionally they exist in regular beds, and contain so large a proportion of hæmatite as to become of considerable importance.

General No.	No. of Series.	—	Ft.	In.
—	—	*Geological Formation. Lias, &c.*		
457 458 459	1 2 3	*Ironstone, Whitby.*		
460 461	4 5	*Ironstone, Middlesborough.*		
462	6	*Silicious Ironstone, Saxelby, near Lincoln.*—Bed 2 to 3 feet thick.		
463 464	7 8	*Silicious Ironstone, near Northampton.*		

The clay ironstones of the lias are only just beginning to add to our iron-making resources. They furnish an instance of the unexpected development of national wealth, arising from the facilities afforded by railroads. Nos. 1, 2, and 3, are raised along the outcrop of the beds along the coast from Whitby to Scarborough. The cost of raising is trifling. Nos. 4 and 5 are from an important bed recently opened at Middlesborough. The thickness of the bed is very irregular, sometimes attaining a thickness of 12 or 14 feet; its average thickness is about 6 feet. Nos. 7 and 8 are from the oolite, near Northampton. They are at present of no commercial value; but are curious, as showing the almost universal dissemination of this important ore.

General No.	*No. of Series.*		Ft.	In.
—	—	*Geological Formation. Green Sand.*		
465	1	*Ironstone, Sussex.*		
466	2			

These specimens are of great interest, as belonging to the formation which was formerly one of our principal sources of iron; but which, furnishing with its ores no fuel to smelt them, was abandoned, upon the exhaustion of its forests, by the iron trade for the coal-fields, where all the requisites for this manufacture exist. Perhaps, like the lias of Whitby, &c., the greensand of Sussex may again, by means of railroads, at no distant period, furnish the iron trade with additional supplies of this important ore.

428 **Stirling, J. D. Morries**, F.R.S.E., *Scotland*, and 13 *Great Cumberland Street, London*—Inventor and Producer.

Pig iron:—Scotch, hot blast.

A. Same iron containing malleable iron scrap.—Process patented in 1846.

A a. The same mixture of malleable and cast-iron melted together, and the pig (or ingot) broken to show the complete union of the metal.

B. Specimens of castings of the mixture, called "toughened cast-iron," and the breaking weights.

C c. Improved patent malleable iron, showing the fibrous structure produced in iron naturally cold short. Process: the addition of zinc or calamine to iron in the puddling furnace. The strength of the iron is thus greatly increased.

D. Hardened, or anti-laminating iron, for the top bar of rails, tires of wheels, &c. This iron, or alloy of iron, has the character of steel, is said to wear well, and not to laminate.

E. Rails composed of *C c* and *D*, to show the difference of the two sorts of iron.

F. Tires of *C c* and *D*.

G. Bell metal, consisting chiefly of iron.

G g. Bells of the same metal, stated to be superior in tone to common bell metal, at a diminished cost.

H. Common zinc cake, broken to show the fracture.

H h. Zinc alloyed with about five per cent. of iron, to show the difference in fracture from the preceding.

I to *O o.* Alloys of copper and other metals with the alloy of zinc and iron.—Patented in 1846-48.

P. Sheets of zinc, and alloys of zinc covered with tin, and alloys of tin.

Q. Sheets of iron covered with zinc, and alloys of zinc, and subsequently with tin, and alloys of tin.

Several other alloys and specimens exhibited for strength, structure, and cheapness.

[The Report of the Commissioners appointed to inquire into the application of iron to railway structures, gives the following as the results of experiments on Mr. Morries Stirling's iron. The tensile strength of No. 1 Calder hot-blast iron is, per square inch, 13,735 lbs., or 6·131 tons. The same iron, mixed with about 20 per cent. of malleable iron scrap, breaks with a weight of 25,764 lbs., or 11·502 tons.

Bars of Brymbo iron 1 inch square, and 4 feet 6 inch bearing, of Nos. 1 and 3, break respectively at 365 lbs. and 416 lbs. The Calder No. 1, not given by the Commissioners, breaks at about 390 lbs. to 400 lbs. With 20 per cent. malleable iron, the Calder breaks at 623 lbs.; and when the proper proportion of scrap is used, the breaking weight is about 800 lbs.

A square inch of Calder, No. 1, is crushed by 72,193 lbs., or 32·229 tons, and 75,983 lbs., or 33·921 tons.

A square inch of Morries Stirling's mixture as above, by 125,333 lbs., or 55·952 tons, and 119,457 lbs., or 53·329 tons.—R. H.]

429 **Bankart, Frederick, & Sons**, *Redjacket Copper Works, near Neath, Wales*—Inventors and Manufacturers.

Various stages of the process of copper smelting, as practised at Redjacket Works, according to the exhibitors' patent process.

[This process is as follows:—Copper pyrites reduced to a fine state of division are roasted at a moderate temperature: the result is, that the sulphur of the ore combines with the oxygen of the air, and thus becomes converted into sulphuric acid. The copper is also oxidized; and the acid combining with it, a sulphate of oxide of copper is produced. A second roasting, with an addition of rich sulphur ore, converts all the metal into this salt. It is now dissolved in water, and the copper precipitated by iron. It has been found that the copper thus prepared is of remarkable purity.—R. H.]

Patent fuel made from small coal, without any foreign admixture; invented and patented by William Rees, Pembrey, Carmarthenshire.

Pure native carbon, found in the collieries of Messrs. Penrose and Starbuck, Vale of Neath, and electrodes manufactured from it by the exhibitors.

430 **Abercarn and Gwythen Collieries Company**, *Newport, Monmouthshire*, Proprietors—E. Rogers, F.G.S., Exhibitor.

Block of Abercarn stone; a hard compact sandstone, which resists the action of the weather and of fire: it forms a part of the carboniferous (or coal-bearing) strata in South Wales. Weight 168 lbs. to the cubic foot. The block is formed in the shape of an obelisk, for the purpose of exhibiting on each face different modes of workmanship in the dressing of the stone.

Block of Abercarn and Gwythen charcoal-vein coal, adapted for steam-ships, and used in the steam marine of the English, French, and Spanish Governments, the Hon. East India Company, &c. This coal is said to resist the action of the weather in any climate, and reference is made to another specimen of this coal, placed at the Western Entrance of the Building, which has been raised and exposed to the weather some years.

Block of Abercarn rock-vein coal, used as a fuel for domestic purposes in the West of England and Ireland.

Specimens of charred coal and tin plates manufactured from the same; this charred coal is stated to be prepared by a process which deprives it entirely of sulphur, and gives it a peculiar mechanical structure, making it as light and pure as wood charcoal, and entirely superseding the necessity of wood charcoal for refining or smelting iron.

A complete set of tools used in mining, and plans, showing the application of electricity to blasting in mines. In a paper accompanying these, the exhibitor states:—It has been often noticed, that, since the application of gunpowder for blasting, few if any improvements have been made in the methods adopted for cutting through hard rocks; and the great expense of maintaining engine power for pumping and winding during the long period required to sink shafts through such rocks has been and is still the sole cause of some of the best and richest tracts of minerals in Great Britain lying idle and unproductive, and has been the principal cause of the loss of life, so serious and often occurring from explosions in mines.

The improvements, or rather the new system, now introduced will be better understood, after a review of the methods and tools heretofore used.

The oldest method of pumping or taking up the water from the bottom of the shaft during sinking was the

Hogar pipe; this was about four feet in length, made of leather, and stiffened by rings of metal; the constant damage this was liable to in blasting caused it to be almost abandoned, and in its place the stock and slide pipe was introduced. This consists of two cast-iron pipes sliding into each other as a telescope, and kept tight in the joint by a stuffing-box: this contrivance is not only expensive in first cost, but liable to breakage and heavy to handle. Both these modes of pumping are subject to a still greater defect; the pump can only be made nearly under the pump trees, so that during a long time of the sinking it often occurs that only two or three men can be effectually employed in the shaft: this, in some of the large shafts (say, in a common size used in South Wales, 18 feet by 10 feet) causes serious delay to the progress of the work.

In boring, it has been customary to use a borer, the body of which was made of wrought iron, and the bit or end of the borer of shear steel welded on to the iron. No attempt appears ever to have been made to fix any definite proportion between the size of the stock or handle and the breadth of the bit; and from this cause a very great portion of the power of the striker has been uselessly expended.

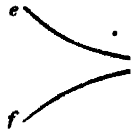
The use of cast-steel borers is, in some respects, entirely new as applied to mining, and by the superior hardness of cast steel as compared with shear steel, greatly expedite the process of boring, and save expense; they have also an advantage in transmitting the force of the hammer to the bit, on account of their stiffness or rigidity; and, further, to prevent loss of power, it is of importance that the bit should be so proportioned to the handle or stock as to work freely in the bore-hole, and, at the same time, spring or bend as little as possible under the blow of the hammer. The following proportions appear to answer these conditions:—

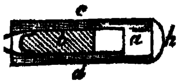
Diameter of Octagon Cast Steel.	Breadth of Face of Bit.
1 inch	1½ inch
1⅛ ,,	1¾ ,,
1¼ ,,	2 ,,
1⅜ ,,	2¼ ,,
1½ ,,	2½ ,,

The suction-pipe now used by the exhibitor is about 20 feet in length, is made of gutta percha, and supersedes the use of the leather Hogar, and stock and slide; it is not liable to accident, and can be repaired easily; it enables the pump-hole to be made in any part of the shaft, and a greater number of men to work in the shaft at one time.

The introduction of electricity as the power for blasting in connection with the improvements before explained, may be said to constitute a new era in the history of mining.

The apparatus at present used for blasting is a Grove's battery of six inches square: this is placed in some convenient position near the top of the shaft; two copper wires, coated with gutta percha, are carried down the shaft, and these are connected to other wires inserted in a small cartridge which is placed in the charge of powder for blasting; the cartridges are formed thus—





e, f, are two thin copper wires covered with gutta percha, and twisted together at *g, g*, to any length required, according to the depth of the hole; *b* is a piece of wood placed to separate the wires to the distance of about $\frac{4}{16}$ths of an inch apart, so that the fine platinum wire inserted and soldered into the copper at *a* shall not be liable to be broken in tamping, or otherwise injured; and further to guard against this, a thin case or tube of pine wood is tied over the wire and distance piece of wood at *c, d*, and the platinum wire covered with fine powder, the end of the tube secured at *h* by paper covering, and the whole case varnished over with a solution of shellac in naphtha. This plan of preparing the cartridge is found by experience very certain and effective; but many other modes can be easily used to obtain the same end.

Fig. 1.

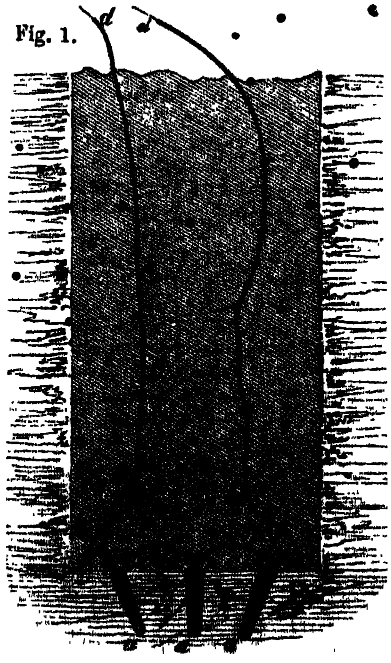


Fig. 2.

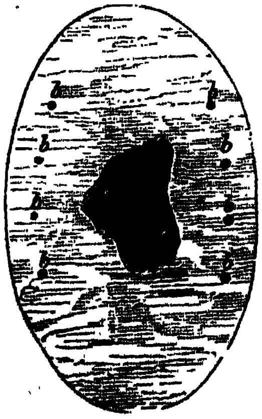

Let fig. 1, be the section, and fig. 2. the plan of a shaft in course of sinking. Let *d, d, d, d*, be the wires leading to the electric battery, then at *a, a, a*, is shown the manner in which the holes are placed to first penetrate a stream of rock (or "enter it" as termed by miners); where one hole only can be fired, the difficulty and delay of entering very hard rock is often serious, and a work of great cost and time. By the method now used three or more holes are bored as shown at *a*, *a*, *a*, and all fired at the same instant of time from the electric battery: the effect of this is to lift up and separate the entire rock contained in the space between *a*, *a*, *a*; after this as many holes as are required are bored in the position shown at *b*, *b*, *b*, *b*, and simultaneously exploded; the effect of this is to rend the rock from the side of the shaft in masses weighing tons each; three or four holes if well placed when fired simultaneously produce more effect than double the number of holes would do if fired separately. Perfect safety from accident to the miners while blasting is secured; and it is not necessary for any workman to leave the bottom of the shaft until the arrangements for firing are completed, and the power of the battery to produce the blast tested.

[The Abercarn stone, worked in the coal-grit of Monmouthshire, has an argillo-silicious cement, and is rather micaceous. There are 25 feet of workable stone, and large blocks can be procured. It is very durable, and not expensive. It weighs about 168 lbs. to the cubic foot. —D. T. A.]

431 Wales, J., *Newcastle*—Producer.

Model of coal mine, old flint wheel, and Davy-lamps.

432 Wood, H. L., *Newcastle*—Producer.

Underground working of coal.

434 Taylor, R., F.G.S., *London*—Proprietor.

Model of the machinery and apparatus used for dressing the inferior copper ores called halvans, at the Tywarnhaile mines, the property of His Royal Highness the Prince of Wales, in the Duchy of Cornwall, consisting of—

Crushing mill, which pulverizes the ore more effectually than the common stamping mills.

Reservoir for receiving the pulverized mineral, and passing it, by the action of a stream of water, to the shaking trunk.

Self-acting shaking-trunk, in which the mineral is separated into proper sizes, for the subsequent processes, by means of a revolving cylindrical sieve, instead of the ordinary process of shaking or stirring it with shovels in a stream of water.

A tye, for cleaning the rough grain ore which does not pass through the cylindrical sieve, and preparing for sale part of the ore which settles at the head.

Double lever jigging machine, for dressing the poorer portion of the mineral from the tye, technically called the tails: by a single operation of this machine, the earthy matter is separated from the ore, and rendered fit for sale. With some qualities of halvans, the use of the tye is dispensed with, and the rough grain comes direct from the shaking sieve to the jigging machine.

Round buddle, for dressing the fine-grained mineral, which passes through the sieve and settles in the shaking-trunk; the ore which it contains is rendered fit for sale by being twice buddled.

Slime pit, for receiving those portions of the mineral which are reduced to so fine a powder as to be carried away, in the shaking and other processes, by the stream of water.

Self-acting trunks, for removing a large proportion of the earthy matter contained in the slimes; when thus concentrated, the slime ore is rendered fit for sale, by being twice buddled.

Specimens of the mineral in its several states of preparation, and of the clean ore, accompany the model.

435 Ruel, Hugh William, 175 *High Holborn*—
Manufacturer and Producer.

Crucibles for assaying, &c.

436 Morewood & Rogers, *Steel Yard Wharf, Upper Thames Street*—Inventors and Manufacturers.

1. Patent galvanised tinned iron corrugated sheet, used in the erection and roofing of buildings; fire-proof, and not liable to be attacked by vermin. Possesses great strength, combined with lightness.

2. Patent galvanized tinned iron sheet, corrugated, and curved; used in the construction of roofs, verandahs, &c.

3. Patent galvanized tinned iron sheet, applicable to most of the purposes for which zinc, iron, or tin-plate are used.

4. Sheet of galvanized tinned iron.

5. Patent stamped tile of galvanized tinned iron, used for roofing of buildings. Is more easily fixed than any other kind of metallic roofing; is less liable to be disturbed by the wind, or otherwise get out of order; and also packs close for shipment.

All the above possess the strength of iron, with perfect protection from rust.

6. Sample of exhibitors' patent tin-plate, more durable and cheaper than the ordinary tin-plate; used for many of the purposes to which tin-plate is applied, and is manufactured in various-sized sheets up to 8 feet long and 3 feet wide.

7. Specimens of moulded gutters and architectural mouldings, made of exhibitors' patent galvanized tinned iron.

8. Samples of Morewood and Rogers's patent plumbic zinc. A new article, consisting of sheet zinc encased in lead; combines the strength of zinc with the power of lead in resisting the action of acids, &c.

9. Sample of patent ferric sheet lead. A new article, combining the pliancy (and power of resisting weather and acids) of lead with the strength of iron. Used for roofing, and other purposes to which sheet lead is applied. May be used much thinner than sheet lead, which renders it cheaper than that material, and it is not liable to pucker and crack from the action of the sun.

10. Sample of exhibitors' patent compound iron and copper wire, the copper being external; possesses the strength of iron combined with the durability and conducting power of copper. Used for electric telegraph and most purposes to which copper wire is applied.

11. Sample of exhibitors' patent compound iron and brass wire, the brass being external.

12. Sample of exhibitors' patent compound iron and lead wire; possesses the strength of iron with the durability and economy of lead.

437 Vieille Montagne Zinc Mining Company. H. F. Schmoll, General Agent, 12 *Manchester Buildings, Westminster*—Producer.

Colossal statue of The Queen on her throne, in the attributes of royalty, eighteen feet high, in imitation of bronze, sculptured by M. Dantin, sen., and cast in zinc by M. Paillard, Paris. (*Nave—Foreign side.*)

Busts of The Queen and H.R.H. Prince Albert, life size, in imitation of bronze, sculptured by Francis.

Statuette of Sir Robert Peel, two feet high, in imitation of bronze, sculptured by Noble.

Eos, favourite greyhound of H.R.H. Prince Albert, life size, in imitation of bronze, sculptured by Francis; all cast in zinc by Karl Schröder, of London.

Model of sections of Her Majesty's ship "Albion," two-decker, of 90 guns, bolted with zinc bolts and painted with zinc paint; by Philip Trant, working shipwright of the Royal Dockyard, Plymouth; these bolts and butts do not rust like iron bolts; they have great strength and durability, and are cheaper than copper bolts.

Model of a frigate of 50 guns, sheathed with zinc and painted with zinc paint; also by Trant.

[Castings in zinc are bronzed in two ways: one is simply the application of a kind of paint, and the other is by producing on the surface an actual coating of copper by electro-chemical action. The use of zinc bolts is of very recent introduction; they appear less liable than iron to corrosion, unless they form part of a galvanic current, when they are rapidly destroyed. Zinc castings bronzed are very durable, and can be produced at a moderate cost. —R. H.]

437A **JACK, CHARLES**, 8 and 9 *Tottenham Court, New Road*, and 80 *Upper Thames Street*—Importer and Manufacturer.

Specimens of perforated zinc, of various patterns; mouldings, sash bars, blinds, and other articles of general utility; manufactured from the zinc imported by "La Vieille Montagne Zinc Company of Belgium."

---

438 **GLOVER, T.**, *Clerkenwell*—Inventor and Manufacturer.

Meters; and the large gas-meter for measuring the gas supplied to the Exhibition Building.

---

439 **BERGER, FREDERICK**, 12 *Cornhill*—Producer.

Specimens of native red and grey copper ores, from Trenance mines, Cornwall. These deposits were taken from the lode now working in the serpentine formation, being part of a slab of copper of 30 feet in length; produce 96 per cent. The grey ore produces 78 per cent.

[The general condition of copper in the serpentine rocks is curious. Fissures running through these rocks are filled in with heterogeneous matters, an occasional slab of native copper being found in the crack. It has not hitherto been usual to discover more than a few isolated patches of copper ore; and Trenance mine, on the junction of the serpentine with the hornblendic slate, is a remarkable exception, producing native copper, the grey sulphuret of copper, and the red oxide of copper.—R. H.]

---

440 **BOLITHO, EDWARD**, *Penzance*—Producer.

Model of a reverberatory tin smelting furnace and circular table, 51 inches in diameter. The table revolves on rollers. The model stands in the centre of the table, and is surrounded by specimens of various ores prepared for smelting, as well as products from the smelting works.

[Near this is placed a model of the dressing floors, in one of the mines of the Duchy of Cornwall, in which will be found illustrations of the mode of washing, &c. The tin ores containing arsenic and sulphur are submitted to a roasting process to expel these, and such as contain wolfram are treated by some chemical method, such as that devised by Mr. Oxland, and elsewhere described. The tin ores are then submitted to the smelting process, as shown in this model, a portion of carbon being employed to prevent the oxidation of the metal.—R. H.]

---

441 **LONGMAID, WILLIAM**, *London*—Manufacturer.

Rock salt, chloride of sodium, from Cheshire. Ore, cupreous pyrites, containing sulphur, copper, silver, oxide of tin, iron, silica, &c., from Cornwall. Salt and ore, mixed and ground. Sulphate ash, the calcined product of the former, containing sulphate of soda, chlorides of silver and copper in a soluble state, and oxides of tin and iron, silica, and other insoluble matters. Bleaching powder, hypochlorite of lime, the chlorine of which is obtained by passing a current of dried air through a close furnace (heated externally) in which the ore and salt are in process of calcination. Silver and copper precipitate, and their produce. Glauber's salts, crystallized sulphate of soda. Salt cake, anhydrous sulphate of soda. Black ash, containing caustic and carbonated soda, sulphide of calcium, and coal. Crude alkali, the lixiviated product of crocus. Purified alkali, or carbonate of soda, obtained from the former. Crystallized carbonate of soda. Bicarbonate of soda. Insoluble portion of sulphate ash. Crocus, oxide of iron, separated from the former by elutriation—iron the produce. Tin ore, binoxide of tin, obtained from the residual matters of the insoluble portion of sulphate ash, by further elutriation, as practised at the mines of Cornwall and Devon, in heating tin ores—tin the produce. Roman, or blue vitrol, sulphate of copper, obtained from copper precipitate, by oxidizing the precipitate and treating it with sulphuric acid. Carburetted oxide of iron. Black ash waste. Black and brown iron paint. Limestone, carbonate of lime.

[The following is a simple explanation of the essential details of this process:—

Copper pyrites (the double *sulphuret of copper and iron*) is combined with salt (*chloride of sodium*), and roasted at a certain moderate temperature. By this, a double decomposition is effected. Sulphate of soda is produced by the combination of the sulphur of the ore with oxygen, to form, first, sulphuric acid, which then unites with the soda of the chloride of sodium. The copper is also converted into a soluble sulphate, the iron being left in a state of peroxidation, and the chlorine liberated, which is employed in the manufacture of bleaching powder.—R.H.]

441A **RICHARDS, ALFRED**, *Redruth, Cornwall*—Designer.

Sectional model of East Pool Mine copper lode, Cornwall; showing its direction by an east and west line marked at the base of the model, and the underlies by a perpendicular shaft. The excavations show where the lode has been developed, and whether it has been worked profitably; the levels, winzes, pitches, &c., are labelled.

This method of modelling is considered to have an advantage over sections drawn on paper, as it shows the direction and underlies of the lodes.

---

442 **BREADALBANE, Marquis of**, *Taymouth, Aberfeldy, Perth*—Producer.

Specimens from the copper mine of Tomnadashin, on the south side of Loch Tay, Perthshire.

---

443 **REDRUTH LOCAL COMMITTEE**, *Redruth*—Collectors and Producers.

Specimens of copper ore from various mines in Cornwall: illustrations of the various processes it undergoes in preparation for the market, together with the methods for determining the percentage of pure copper. Specimens of the stratum in which the ore is found.

No.	Description of Ore.	Mine.	Parish.	Stratum.

[The county of Cornwall is the most important mineral district of the United Kingdom, for the number of its metalliferous minerals, many of which are not found in any other part of our islands. At a very early period of our history, mines were worked around the sea-coasts of Cornwall, of which the evidences are still to be seen at Tol-pedden-Penwith, near the Land's End; in Gwennap, near Truro; and at Cadgwith, near the Lizard Point. The traditionary statements that the Phœnicians traded for tin with the Britons in Cornwall, are very fairly supported by corroborative facts; and it is not improbable that the *Ictes*, or *Iktis*, of the ancients was St. Michael's Mount, near Penzance.

In the reign of King John, the mines of the western portion of England appear to have been principally in the hands of the Jews. The modes of working must have been very crude, and their metallurgical processes exceedingly rough. From time to time the remains of furnaces, called *Jews' houses*, have been discovered, and small blocks of tin, known as *Jews' tin*, have not unfrequently been found in the mining localities.

Till a comparatively recent date, tin was the only metal which was sought for; and, in many cases, the mines were abandoned when the miners came to the "yellows," that is, the yellow sulphuret of copper. The greatest quantity of tin has been produced by "streaming" (as washing the debris in the valleys is termed); and this variety, called "stream tin," produces the highest price in the market.

The conditions under which these deposits occur, are curious and instructive. At the Carnon Tin Stream Works, north of Falmouth, the rounded pebbles of tin are found at a depth of about 50 feet from the surface, beneath the bottom of an estuary, where trees are discovered in their place of growth, together with human skulls, and the remains of deer, amidst the vegetable accumulations which immediately cover the stanniferous beds. According to Mr. Henwood's measurement, the section presents first about 50 feet of silt and gravel; then a bed of 18 inches in thickness of wood, leaves, nuts, &c., resting on the tin ground, composed of the debris of quartz, slate, and granite, and the tin ore. At the Pentuan Works, near St. Austell, similar deposits occur, proving a material alteration in the level during the period expended in the formation of this deposit. Tin is also worked out of the lode in many parts, the ore occurring both in the slate and the granite formations. The modes of "dressing" the tin ore, preparing it for the smelter, and the processes of smelting, are illustrated in the Exhibition.

There has been a remarkable uniformity in the quantity of tin produced in Cornwall during a long period, as will be seen from the following table:—

Years.	Tons.	Price per Cwt. £.	s.
1750	1,600	..	
1760	1,800	..	
1770	2,000	..	
1780	1,800	3	0
1790	2,000	3	15
1800	1,500	5	0
1810	1,400	7	0
1820	1,700	3	5
1830	3,500	3	0
1840	5,000	3	15

of this metal within the last f
been as follows:—

Years.	Tons.
1844	7,507
1845	7,739
1846	8,945
1847	10,072
1848	10,176
1849	10,719

The copper mines, now so important, were so little worked until a recent period, that, in 1799, we are told in a Report on the Cornish mines, "it was not until the beginning of the last century that copper was discovered in Britain." This is not correct, for in 1250, a copper mine was worked near Keswick, in Cumberland. Edward III. granted an indenture to John Ballanter and Walter Bolbolter, for working all "mines of gold, silver, and copper:" but that the quantity found was very small is proved from the fact, that Acts of Parliament were passed in the reigns of Henry VIII. and Edward VI., to prevent the exportation of brass and copper, "lest there should not be metal enough left in the kingdom fit for making guns and other engines of war, and for household utensils:" and in 1665, the calamine works are encouraged by the Government, as "the continuing these works in England will occasion plenty of rough copper to be brought in."

At the end of the seventeenth century, some "gentlemen from Bristol made it their business to inspect the Cornish mines, and bought the copper for two pounds ten shillings per ton, and scarce ever more than four pounds a ton."

In 1700, one Mr. John Costar introduced an hydraulic engine into Cornwall, by which he succeeded in draining the mines, and "he taught the people of Cornwall also a better way of assaying and dressing the ore."

The value and importance of the copper mines since that period has been regularly increasing. During a term of about 30 years, 220 mines have sold their ores at the public sales. The following table, from a report by Sir Charles Lemon, Bart., M.P., represents the progress of copper mining, from 1771 to 1837:—

Years.	Tons of Ore.	Tons of Copper.	Total Value of Ore.	Standard Value per Ton.
			£.	£.
1771	27,896	3,347	189,609	81
1780	24,433	2,932	171,231	83
1799	51,273	4,223	469,664	121
1800	53,981	5,187	550,925	133
1802	53,937	5,228	445,094	111
1805	78,452	6,234	864,410	170
1808	67,867	6,795	495,303	100
1809	76,245	6,821	770,028	143
1812	71,547	6,720	549,665	111
1814	74,322	6,369	627,501	130
1816	77,334	6,697	447,959	98
1818	86,174	6,849	686,005	135
1821	98,426	8,514	605,968	103
1825	107,454	8,226	726,353	124
1827	126,710	10,311	745,178	106
1831	146,502	12,218	817,740	100
1837	140,753	10,823	908,613	119

The produce of the copper mines of Cornwall, since 1845, has been as follows:—

Years.	Ore in Tons.	Copper in Tons.	Money Value. £.	s.
1845	162,557	12,883	919,934	
1846	150,431	11,851	796,182	
1847	155,985	12,754	889,287	
1848	147,701	12,422	720,090	
1849	146,326	11,683	763,614	
1850	155,025	12,254	840,410	

With the improvements in the construction of the steam-engine, the facilities for working the mines have been increased. The first steam-engine employed in the county was set to work at Huel Vor Tin Mine, near Helstone, in 1713, by Newcomen; but it was not until the reconstruction of the engine was effected by Watt, that steam power was generally employed for draining the mines. The rapid advance made by Cornish engineers in the perfection of their engines will be seen by the following return of the duty, that is, the performance of each, which is reckoned by the number of millions of pounds lifted a foot high by the consumption of a bushel of coals:—

Name of Mine.	Highest Duty.
Stray Park, 1813 . . .	29,000,000
Dolcoath, 1816	40,000,000
Consolidated Mines, 1822	44,000,000
Consolidated Mines, 1827	67,000,000
Fowey Consols, 1834 . .	97,000,000
United Mines, 1842 . .	108,000,000

A brief statement of the quantity of coals consumed per month, in a few of the principal mines, will show the extent to which steam power is now employed.

	Bushels of 94 lbs.
Fowey Consols, 1835 . . .	101,246
Godolphin, 1839 . . .	129,801
Fowey Consols, 1840 . . .	203,099
United Mines, 1842 . . .	84,862

Two examples of Cornish engines may be seen near the Metropolis, one at the East London Water Works, and the other at Brentford.

The lead mines of Cornwall have produced of the argentiferous sulphuret, during five years, the following number of tons of ore:—

	1845	1846	1847	1848	1849
Callington . . .	950	2,138	1,249	957	625

Huel Golden . .	..	..	..	..	80
Cartheu Consols . .	..	..	5	..	45

The produce of zinc is not easily attainable, but it is now somewhat considerable, as is also that of arsenic, and of the iron pyrites, used in the manufacture of sulphuric acid.

The number of individuals employed in 59 Cornish copper mines, was computed by Sir Charles Lemon, in 1837, to be—

Men	10,624
Women . . .	3,802
Children . . .	3,490

The men alone work underground; the women and children are employed on the surface, picking and dressing the ore.

Mr. W. J. Henwood estimates the number employed at—

Men	18,472
Women . . .	5,764
Children . . .	5,764
	30,000

Beside the minerals peculiarly industrial, a very large variety of beautiful mineralogical specimens are produced in the county. A large trade in kaolin—china-clay—is carried on; and of the building and ornamental stones of Cornwall, granites, slates, porphiries, serpentines, and other kinds, a considerable variety in the natural state, and wrought into articles of use and ornament, will be found in the Exhibition. The accompanying map is intended to furnish information as to the metalliferous mineral wealth of Great Britain generally, and the site of different mines is represented by symbols which will render the map intelligible as a means of reference in studying the metalliferous minerals in Class 1.—R. H.]

444 **GRYLLS, S., & REDRUTH COMMITTEE**—Producers.
A large mass of copper pyrites.

445 **LEAN, J.**, *West Caradon Mine, Liskeard*—Producer.
Grey and native copper ore.

446 **PUCKEY, JOHN**, *St. Blazey, St. Austell*—Agent.
Mass of copper ore, about 1,500 lbs. in weight, from Par Consols Mine, St. Blazey, Cornwall. This specimen contains some quartz and chlorite, and shows the "walls" and inclination of the lode.

[The produce of this mine for some years has been as follows:—

Years.	Ore in Tons.	Copper in Tons.	Copper in Cwts.	Total Value. £.
1845	5,655	464	10	30,881
1846	6,065	557	12	35,144
1847	6,101	625	10	42,953
1848	8,470	914	8	52,353
1849	12,228	736	9	47,249
1850	7,152	641	2	44,090

—R. H.]

447 **WELLBORNE, W.**, *Bodmin*—Producer.
Specimens of iron ore.

448 **TAYLOR, J.**, *Cornwall*—Producer.
Iron ores from Restormel.

449 **DREW, JOSEPH**, *St. Austell*—Producer.
Iron ore, magnetic and oxidulated, from the Trerank mine, near St. Austell. Brown hæmatite, from the same mine. Iron ores. Red hæmatite, from Treverbyn mine.

450 **BENNETT, CARR, & Co.**, *Moorgate Street*—Producers.
Copper ores, gossan, &c., St. Brenard, Cornwall.

451 **TAYLOR, R.**—Producer.
Mining tools, as used in the Cornish mines.

452 **DUCHY OF CORNWALL**—Producer.
Sections of Cornish copper mines.

453 **DEVON GREAT CONSOLIDATED COPPER MINING COMPANY**, *Tavistock*—Producer.
Specimens of copper ore.

454 **SECCOMBE, SAMUEL**, *Phœnix Mines, Liskeard*—Producer.
Specimens of tin and copper ore, and gossan. Pieces of copal and of the stratum from the side of the lode.—All from one lode in Phœnix mines in the parish of Lenkinghorne, near Liskeard.
Specimens of fire-bricks.
Specimen of native copper from West Caradon mine.
Piece of barytes from Wheal Mary Ann.

455 **WELLBORNE, W.**, *Bodmin*—Producer.
Specimens of tin ore and tin.

456 **READWIN, T. A.**, *Winchester Buildings*—Producer.
Tin stone, from Wheal Augusta, St. Just.

457 **DIAMOND, J.**, *Tavistock*—Producer.
Specimens of tin ore. from Wheal Mary.

457A **BIRD, J.**, *Wallwyd, Merioneth, Wales*—Proprietor.
Specimen of silver lead ore, weighing 350 lbs., containing 16 cwt. 3 qrs. 10 lbs. of lead per ton, 82¾ oz. of silver per ton of lead, extracted from the great Cowarch silver lead mine, which has been in work seven years, and is situate on the Browddwy estate, the property of the exhibitor. Exported from Aberdovey, North Wales.

458 **COLLETT, WM. R.**, *Gort, County Galway*—Producer.
Cahirglissaun silver-lead ore; found in carbonate of lime between Gort and Kinvara, County Galway, Ireland. The parting assay of Messrs. Johnson is—

Lead	45
Copper	21
Sulphur	23
Antimony and arsenic	8
Silver	1·1
Earthy matter and loss	1·9
	100·0

About 30 tons of this ore have been raised last year. It is much esteemed in the market.

459 Blee, Robert, *Redruth*—Inventor.

Safety bucket to be used in mines for drawing up persons or produce. This bucket is furnished with guides to run in grooves which extend along the whole depth or shaft of the pit. To the guides are fixed strong crooks to which the drawing-rope is attached. So long as the tension of the rope continues, the crooks are held in over the bucket. Should the rope break, and its tension consequently cease, the crooks are immediately thrown out by springs, which constantly act on them, and cause the crooks to take hold on the iron staves of strong ladders fixed at the back of the grooves throughout their length.

460 Polkinghorne, W., *Fowey Consols Mine, Tywardreath*—Inventor.

A synopsis of the Cornwall ticketings for copper ores from 1800 to the present time; together with a synopsis of the Swansea ticketings from 1815 to the same period; which contains the following information, viz., the standard, produce, price, and quantity of copper ores sold, amount of money realised, and the quantity of fine copper produced, with the respective fluctuations for each year, as well as for every six years; exhibiting also the totals and averages for the whole period collectively. The object of this synopsis is to show to all interested in the copper trade, at one glance, the state of the copper market during the past half century. The novelty of this document consists in its arrangement, and the invention of the diagram, which shows the different valuations of the standard each year by coloured lines, differing in length, so that for the highest, lowest, or intermediate years, the observer, by following the line, can at once obtain the information he requires without scanning the columns. This synopsis, from its valuable tabular matter, will be useful not only to miners, but to statists in general.

461 Michell, F.—Producer.

Pick for dressing granite.

462 Arthur, J.—Inventor.

Apparatus for lifting pumps from mines full of water.

463 Eddy, J.—Inventor.

Apparatus for lifting pumps.

464 Tresize, T., *Perran Foundery*—Maker.

Model of improved smelting furnace.

465 Vincent, T., *Redruth*—Producer.

Model of a steam-engine by a working miner.

466 Hosking, R., *Perran Foundery, Falmouth*—Producer.

Model of compound valve for pumps.

467 The Truro Local Committee—Producers.

Articles illustrating lead, from East Wheel Rose, near Truro, Pentire Glase, near Wadebridge, and other Cornish mines.

[Wheel, or wheal, appended to the names of most of the Cornish mines, is a corruption from an old word, probably Cornish, Huel, which was employed to signify a mine.

East Wheel Rose has proved the most productive lead mine in the west of England, the returns of lead from this mine being for a few years as follows:—

Years.	Ore in Tons.	Lead in Tons.
1845	7,883	5,191
1846	4,729	3,114
1847	6,424	3,854
1848	4,758	2,856
1849	5,335	3,191.—R. H.]

468 The Truro Local Committee—Producers.

Articles, illustrating tin, from various Cornish mines (supplied by George Nicolls Simmons, Mr. Henry Borrow, of Truro; Capt. Webb, of St. Austell; Capt. Evans, of St. Agnes; Mr. J. N. R. Millett, of Penzance; and other gentlemen, from Great Beam Mine, near St. Austell, Budnick Mine, in Perranzabulal, Rocks Mine, in St. Agnes, Friendly Mines, in St. Agnes; Mineral Court Mine, in St. Stephen's, and from various mines in the Penzance district), exhibiting the ore in its various stages until it leaves the miner's hands as black-grain tin. A block of white tin very free from impurity, the produce of Mineral Court Mine, supplied by the shareholders, and a rude smelted block of tin supplied by Mr. G. N. Simmons, found in Ladock, near Truro, and supposed to have been smelted when the Phœnicians traded to Cornwall for tin.

[Tin appears to have been raised in Cornwall from a very early period. Traditionary evidence, supported by strong corroborative facts, appears to prove that the kingdoms around the Mediterranean Sea were supplied with tin from Cornwall by the Phœnician merchants at a very early date. The circumstance of this metal being found in the beds of streams, and in deposits at the base of the primary rocks, from which it could be obtained without much labour, may have been the cause of its being early known to the Britons.

The oxide of tin is usually found deposited in beds in water-worn pebbles, and mixed with the debris of the neighbouring hills. There can be but little doubt that these tin deposits are the result of the disintegrating action of the atmospheric causes and of water; some of the tin beds, 30 or 50 feet from the present surface, contain vegetable matter, as branches of trees, and large logs of wood; and at Carnon stream works, human skulls were discovered amidst the debris, 53 feet below the surface.

Tin is also found in the lode, either as peroxide, cupreous-sulphuret of tin, or tin pyrites, the analysis of the peroxide giving—peroxide of tin, 96·265; silica, 0·750;, peroxide of iron and manganese, 3·395.

Many indications of early tin-mining are to be found in Cornwall, as stated in a preceding note. For many centuries the Dukes of Cornwall drew a large revenue from its tin. The tin when smelted into blocks was forwarded to the nearest coinage town, there to be stamped by the Duchy officers, who cut a piece off the corner of each block, which was retained as the Duchy's dues. In 1337, Edward the Black Prince was created Duke of Cornwall, and then the average profit of the coinage was 4,000 marks per annum. In 1814, the revenues to the Duchy from tin was about 8,500*l.*, and the average tin revenue from 1820, to the abolition of the coinages in October, 1838, has been estimated at 12,000*l.*, per annum. In 1750, about 2,000 tons of tin were produced in Cornwall, and in 1838, about 5,000; since that period the quantity cannot be accurately ascertained, the trade in tin being in the hands of a few, and the purchases of ore being usually made by private contract.—R. H.]

469 **LOCAL COMMITTEE**, *St. Austell*—Collector.

Alluvium, in which stream tin ore is found. The ore as prepared for sale. Specimens of pebbles of tin ore.

Building stones from the vicinity of St. Austell, prepared in cubes.

---

470 **WELBORNE, J. W.**, *St. Austell*, and 38 *Albemarle Street*—Producer.

Slab of rosin tin ore, from the Par Consols Mine, near St. Austell, Cornwall.

Stone of the magnetic oxide of iron, from Roche Rock iron mine.

Sulphuret of copper, or yellow copper ore, from Bodmin Wheal Mary Consols, near Bodmin.

471. **WHITE & GRANT**, *Dalmarnock Road, Glasgow*—Inventors and Manufacturers.

Patent safety cage and detaching catch for mine-shafts, to prevent accidents from the breaking or over-winding of ropes or chains.

---

472 **HOSKING, R.**, *Perran, Cornwall*—Inventor.

Reversing apparatus, for horse whim and stamping machinery.

---

473 **SWANSEA COMMITTEE**, *Swansea*—Manufacturers.

Specimens of copper ore, and of calcined ore, blistered and refined copper, &c.

---

474 **TAYLOR, JOHN**, *London*—Producer.

Collection of rare and metalliferous metals.

475 **THORNE, WILLIAM**, *Barnstaple*—Proprietor.

Pseudomorphic spathose iron, showing the structure of box and slipper specimens; yellow sulphuret of copper; peacock copper; foliated mundic and crystallized white quartz; from the Virtuous Lady Mine, near Tavistock, Devon.

[These singular formations are due to the deposit of the sulphuret of iron upon crystals of sulphate of lime, which have been dissolved out subsequently. They have been rarely met with in any other mine.—R. H.]

Crystallized white iron, with lead and Fahlertz ores, containing silver, from the Combmartin Mines, in North Devon.

Specimens of killas, or clay slate, white iron, crystallized white quartz, mundic, and lead and Fahlertz ores, from the Wheal Golden Mine, Perranzabuloe, Cornwall.

Hydraulic cement and raw mineral paint, from Bickington Quarry, near Barnstaple, Devon.

Ashlar-stone, hone-stone, clay, and granite gravel, from Tavistock, near Barnstaple.

---

476 **GOODHALE & REEVES**, *for the Ringerige Nickel Work, Vigersund, viâ Drammen, Norway*—Proprietors and Producers.

Nickel ore; from mines in the district of Ringerige, in Norway (about thirty miles north-west from Christiania), worked only last year: containing 2·80 per cent. nickel, with 40·46 sulphur, 56·03 iron, and 0·40 copper.

[The Norwegian mines have lately attracted much attention in this country on account of the cobalt and nickel ores they contain.—R. H.]

---

477 **JOHNSON & MATTHEY**, 79 *Hatton Garden*—Manufacturers.

Specimens of metals and metallic compounds:—Platinum crucibles, with capsule covers; and with ordinary covers. Capsules, spatula, and large basin of this metal; oxide and sponge platinum.

Palladium; part of an ingot; a cup, soldered with fine gold; another, smaller, raised with the hammer; alloy of silver and palladium used by dentists and philosophical instrument makers; oxide of palladium; and its salts, red and yellow.

Iridium; pure metallic in vase; and the native alloy, as used for nibs of pens; its oxide and salts.

Rhodium; metallic in vase; its crystal of sodo-chloride; oxide; and phosphuret.

Uranium; its oxide; glass vessel showing the colour produced by the oxide of uranium.

[Platinum was discovered by Ulloa in 1735, but it was first rendered available by Dr. Wollaston. The largest supply of the metals platinum, palladium, iridium, rhodium, and uranium, is obtained from the Uralian Mountains; some is procured from the alluvial deposits of Brazil and other parts of South America. These metals, except uranium, are commonly found combined. Uranium is procured from pitchblende, uranite, and other minerals found in Cornwall and Bohemia.—R. H.]

[The colour produced by mixing a minute portion of the oxide of uranium in a mass of molten glass is one of the most beautiful colours obtained by art. It is a charming golden green of an opalline lustre, so peculiar as to distinguish it from all other colours in glass.—R. E.]

480 **PATTINSON, HUGH LEE**, *Newcastle-upon-Tyne*—Inventor.

Specimens to illustrate the exhibitor's process for the separation of silver from lead: viz., original lead; crystallized lead; slabs of lead, to show the form of the crystals; rich lead; plate of silver obtained by submitting rich lead to cupellation. Large drawing to illustrate the process.

[This process of desilverizing lead is founded on the physical fact, that lead crystallizes at a temperature above that at which silver solidifies, and in this process of aggregation, the silver is separated from the commoner metal. It is effected by the use of hemispherical cast-iron pans, holding about three tons of metal, which are heated by a fire below them; the argentiferous lead is placed in these, and melted, after which the fire is withdrawn, and all made air-tight below. The workman now begins to agitate the mass, which he does with an iron rake, removing the solid parts from the edges, as solidification takes place. With an iron strainer the solid crystals are removed as fast as they are formed; these are nearly pure lead, the liquid mass left behind being rich in silver. This process is repeated three or four times, the mass left after the last operation, which contains from 3 to 400 ounces of silver to the ton, is then submitted to the process of cupellation, by which the lead is oxidized, and the silver left in a state of purity behind.

By the original method, lead ores containing less than 20 ounces of silver to the ton scarcely paid the expense of working. By this process, ores containing only three ounces to the ton, are made to yield their silver.—R. H.]

lity Regulus."—Used principally to harden other soft and ductile metals; viz., with lead and tin for printing types; with copper and tin (and sometimes lead), for Britannia or Queen's metal, pewter wares, &c. Melted with tin, it has of late been used as an anti-friction alloy, for railway axles and other bearings, in metallic rings or collars for machinery, &c. As this alloy is not so much heated by friction as the harder metals, less grease is consumed.

483 **A Collection of Minerals,**

Contributed by agents and workmen connected with the lead mines of Allendale, Alston Moor, Weardale, Caldbeck, and Keswick, including 2,000 specimens, arranged and cemented together by Mr. Isaac Robinson, of Nenthead, for the Great Exhibition of 1851, under the general superintendence and direction of Mr. T. Sopwith, and a Committee of Mining Agents connected with the above districts.

The following is a catalogue of the above minerals:—

No.	Name of Mineral.	Locality.	Contributor.
	Matrix of quartz	West Allendale	Matthew Millican.
	Quartz	Nenthead	Isaac Robinson.
	Sulphuret of zinc and carbonate of iron	Nenthead	Isaac Robinson.
	Quartz	Nenthead	Isaac Robinson.
	Carbonate and sulphuret of iron	Nenthead	Thomas Cain.
	Fluor, capped with quartz	Allenheads	W. B., Lead Mines.
	Carbonate of lime	Nenthead	Isaac Robinson.
	Sulphuret of zinc, with carbonate of iron	Nenthead	Jacob Walton.
	Fluor	Teesdale	Thomas Watson.
	Sulphuret of zinc with carbonate of iron	Nenthead	Isaac Robinson.
	Madrepore coral, crystallized with quartz and carbonate of iron	Nenthead	Thomas Cain.
	Quartz	Nenthead	Isaac Robinson.
	Quartz, with carbonate of iron and sulphuret of zinc	Nenthead	Jacob Walton.
	Fluor and sulphuret of iron	Allenheads	W. B., Lead Mines.
	Fluor, capped with quartz	Allenheads	W. B., Lead Mines.
	Sulphuret of zinc, with iron pyrites	Allenheads	W. B., Lead Mines.
	Fluor, capped with quartz	Allenheads	W. B., Lead Mines.
	Sulphuret of zinc and carbonate of iron	Nenthead	Isaac Robinson.
19	Carbonate of iron and lime with sulphuret of zinc	Alston Moor.	Robert Broadwood.
	Quartz	Nenthead	Isaac Robinson.
	Fluor	Allenheads	W. B., Lead Mines.
	Carbonate of iron	Nenthead	Thomas Cain.
	Fluor	Nenthead	Isaac Robinson.
	Fluor, capped with quartz	Weardale Mine	W. B., Lead Mines.
	Fluor, covered with arragonite	Nenthead	William Wallace.
	Quartz	Nenthead	Isaac Robinson.
	Quartz with sulphuret of zinc	Nenthead	Isaac Robinson.
	Fluor, with carbonate of iron	Allenheads	W. B., Lead Mines.
	Carbonate of lime	Garrigill	William Hayton.
	Sulphuret of zinc and carbonate of iron	Nenthead	Isaac Robinson.
	Carbonate of iron, sulphuret of zinc with quartz	Nenthead	Jacob Walton.
	Brown blend	Allenheads	W. B., Lead Mines.
	Fluor	Nenthead	Isaac Robinson.
	Sulphuret of zinc and arragonite	Nenthead	William Hayton.
	Sulphuret, capped with quartz	Nenthead	Isaac Robinson.
	Fluor and carbonate of iron	Nenthead	Jacob Walton.
	Quartz, with sulphuret of zinc	Nenthead	George Rutherford.
	Carbonate and sulphuret of iron, with sulphuret of zinc	Nenthead	John Froest.
39	Quartz and sulphuret of zinc	Nenthead	Isaac Robinson.
	Fluor and quartz	Allenheads	Isaac Robinson.
	Arragonite tinged with iron	West Allendale	Wallace Millican.
42	Quartz, carbonate of iron, and sulphuret of zinc	Nenthead	Jacob Walton.
	Sulphuret of zinc	Nenthead	Isaac Robinson.
	Carbonate of iron and sulphuret of zinc	Nenthead	Thomas Watson.
	Fluor, capped with quartz	Allendale	W. B., Lead Mines.
	Carbonate of iron and fluor	Allendale	W. B., Lead Mines.
	Carbonate of lime	Garrigill	William Hayton.
	Fluor, covered with quartz	Weardale	W. B., Lead Mines.
	Quartz upon sulphuret of zinc	Nenthead	Isaac Robinson.
	Fluor	Allenheads	W. B., Lead Mines.
	Sulphuret of zinc, carbonate of iron, and quartz	Nenthead	Joseph Hayton.
	Yellow fluor, capped with quartz	Nenthead	William Wallace.
	Carbonate of lime on quartz	Garrigill	William Thompson.
	Carbonate of lime on quartz	Garrigill	William Wallace.
	Quartz, capped with carbonate of iron	Nenthead	Jacob Walton.
	Quartz	Nenthead	Isaac Robinson.
	Carbonate of lime	Nenthead	William Wallace.
	Phosphate of lead	Caldbeck Fells	Sam. Merryweather.
	Fluor, with carbonate of iron	Allenheads	Isaac Robinson.
	Carbonate of lime	Allenheads	Isaac Robinson.
	Sulphate of barytes	Westmoreland	Isaac Robinson.
	Sulphuret of lead	Nenthead	Thomas Wilkinson.
	Sulphuret of lead with iron pyrites	Garrigill	Joseph Walton.
	Quartz	Nenthead	Isaac Robinson.
	Sulphuret of lime upon quartz	Nenthead	William Hayton.
	Fluor	Allenheads	W. B., Lead Mines.
	Arragonite	Nenthead	William Hayton.
	Iron pyrites	Allenheads	W. B., Lead Mines.
	Quartz	Nenthead	Jacob Walton.
	Fluor, with iron (sulphuret)	Allenheads	W. B., Lead Mines.
	Fluor and carbonate of iron	Allenheads	W. B., Lead Mines.
72	Sulphate of barytes, tinged with iron	Keswick	Jacob Walton.
	Sulphate of barytes, tinged with iron	Keswick	Jacob Walton.
	Fluor	Allenheads	W. B., Lead Mines.
	Fluor and carbonate of lime	Allenheads	W. B., Lead Mines.
	Sulphuret of lead and yellow fluor	Allenheads	W. B., Lead Mines.
	Fluor upon quartz	Allenheads	W. B., Lead Mines.
	Quartz	Nenthead	Isaac Robinson.
	Sulphuret of zinc and carbonate of iron	Nenthead	Isaac Robinson.
	Carbonate of lime	Teesdale	Thomas Watson.
	Quartz upon fluor	Weardale	W. B., Lead Mines.
	Fluor, capped with quartz	Garrigill	Joseph Walton.
	Fluor and carbonate of lime	Allenheads	W. B., Lead Mines.
	Green carbonate of copper and sulphuret of copper	Caldbeck Fells.	Sam. Merryweather.
	Yellow fluor	Nenthead	Robert Thompson.
	Arsenic, phosphate of lead and manganese	Hesketh	Joseph C. Cain.
	Arsenic, phosphate of lead, and manganese	Hesketh	Joseph C. Cain.
	Carbonate of lime	Alston Moor	Joseph C. Cain.
	Fluor, covered with carbonate of iron	Allenheads	W. B., Lead Mines.
90	Limestone, with a weak string of lead	Nenthead	Isaac Robinson.
	Plate	Nenthead	Isaac Robinson.
	Hazle	Nenthead	Isaac Robinson.
	Green carbonate of copper	Stavely, Westmoreland	Joseph C. Cain.
	Quartz	Green Castle	T. B. Leonard.
	Carbonate of lime	Nenthead	Thomas Watson.
	Sulphuret of zinc and quartz	Nenthead	Isaac Robinson.
	Arsenic, [illegible] lead	Caldbeck Fells.	Joseph C. Cain.
	[illegible] lead	Caldbeck Fells.	Joseph C. Cain.
	Green carbonate [illegible] copper	Caldbeck Fells.	Sam. Merryweather.

484 **SOPWITH, THOMAS, F.R.S., &c.,** *Allenheads, Northumberland*—Inventor and Producer.

Specimens of lead ores and associated minerals, with examples of the various stages of progress, from their being excavated in the mine and carried through the several departments of washing and smelting, until furnished and ready for the market in the form of a cake of silver, and a pig, or piece of lead, known as W. B. Lead.

The specimens of minerals usually associated with lead ores are collected from various mines, and are fitted together in a separate case, under the direction of the exhibitor, by Messrs. Cain and Wallace of Nenthead, and others.

The general arrangement of the strata in which these ores and minerals are found, is exhibited by a section of part of the lead-mining district belonging to Wentworth Blackett Beaumont, Esq., at Allenheads, in the county of Northumberland, and from whose mines the specimens of lead ores and examples of processes *during conversion into lead and silver* are taken; and a further illustration of the geological structure of this part of England is given by an isometrical plan and section by the exhibitor, showing a considerable tract of mining ground in the manor of Alston Moor, in the county of Cumberland.

The principal phenomena of mineral veins and displacement of the strata in which lead ore is obtained in the north of England, are shown by dissected models invented by the exhibitor, and examples of the finished products are contained in a separate case, from Mr. Beaumont's smelt-mills, under the direction of his agent, Mr. Thomas Steel.

This collection, the general nature of which is here briefly indicated, is intended to illustrate the geological position and usual products of the north of England lead-mines. The following is the order of the five several portions, and which are more particularly described under these several heads in the sequel:—

I. SECTIONS OF STRATA AT ALLENHEADS AND ALSTON.
II. MODELS TO ILLUSTRATE MINERAL VEINS, ETC.
III. MINERALS ASSOCIATED WITH LEAD ORES.
IV. EXAMPLES OF THE VARIOUS STAGES OF PROGRESS FROM THE MINE TO THE MARKET.
V. LEAD AND SILVER PREPARED FOR SALE.

I. As the express object of this collection is to afford a general view of the whole of the principal features relative to the extensive and important departments of British industry connected with lead-mining, and as this information is more expressly intended for the use of those who are not locally conversant with the physical conditions under which lead ores are usually obtained, the exhibitor has, in the first instance, thought it necessary to present clear and distinct views of the geological structure of the district in which the chief lead-mines of the north of England are situated, in order that, without going into purely technical details, which are only of local interest, the several strata and order of superposition may be readily understood.

As an approximate comparative view of produce, it may be considered that the lead raised in Mr. Beaumont's mines amounts to about one-fourth of the quantity raised in England, about one-sixth of the produce of Great Britain, and about one-tenth of that of the whole of Europe, including the British Isles. They have been extensively worked from time immemorial; part of them are situated in the manors belonging to Mr. Beaumont in the dales of East and West Allen, in the south-west part of Northumberland, and others are situated in the wild district of moors which forms the western extremity of the county of Durham.

This part of the country happens to be at once the centre of the island of Great Britain, and by far the most elevated part of it, which is thickly populated, for, scattered over hills and dales which present an aspect of verdant cultivation, mixed with heathy moors, are to be found some thousands of inhabitants, nearly the whole of them either employed in lead-mines or smelting-mills, or indirectly deriving a livelihood from some connection with lead-mining business. Allenheads forms a central position in the midst of these mines, and the agent's house, shown on the section, is exactly 1,400 feet above the level of the sea, and is the highest house of its magnitude in Great Britain,—nor are many of the cottages of shepherds, and other moorland habitations, of greater elevation.

The datum, or base line of the ALLENHEADS SECTION, is 700 feet above the level of the sea. The drawing, 16¼ feet in length, is on a true scale of 100 feet to an inch; by a true scale being meant, that the lengths and heights are projected to the same scale or proportion, so that a true miniature profile of the country is given, as well as a correct reduction of the relative size of the various rocks. The extent of country thus shown is not quite 4 miles, being 3 miles 1,220 yards.

The spectator is supposed to be looking to the north, and the section commences at a point about half a mile eastward from a place called Kilhope Head, which is conspicuously marked in all English maps, inasmuch as the three counties of Northumberland, Durham, and Cumberland all meet in one spot. At about three-quarters of a mile from the point of commencement, the section represents the hill called Kilhope Law; it is on the boundary line of the counties of Northumberland and Durham, and is the highest point of land in the last-named county, being 2,206 feet above the level of the sea. But out of the limits of this section, and about 10 miles south-west from Kilhope Law, the same strata which are here delineated reach an altitude of 2,901 feet above the sea, and this is the highest elevation attained by the rocks which form the carboniferous or mountain limestone of the north of England.

Such being the stratification of the central portion of the narrow part of the island, of which the coal-fields of the Tyne and Wear form the extremity on the east, bordering the German Ocean for some distance north and south of Newcastle, while a similar coal-field is found at the western extremity near Whitehaven, it may be observed, with reference to these coal-fields, that they lie over or upon the mountain limestone formation. The coal-beds so extensively worked in the Newcastle and Durham coal-mines, or collieries, gradually rise to the west, and one by one crop out, or bassett, according to the undulations of the country. At length, at about 20 miles west of the German Sea, the lowest of the coal-beds crops out, and from beneath it gradually appear the limestone strata, which continue to rise nearly coincident with the general rise of the country until they reach the summit of Cross Fell (2,901 feet); and this general and very gradual inclination of the strata, a feature of the greatest importance in practical mining, is clearly and accurately delineated in this section.

In a thickness of about 2,000 feet of the alternating beds of sandstone, clay, and limestone, which form the strata of the mining districts of Allendale, Alston, and Weardale, there is one single stratum of limestone called the "great limestone," the veins in which have produced nearly, if not quite, as much ore as all the other strata put together. This stratum is delineated on the section, and may be observed lying at a depth of about 850 feet below the summit of Kilhope Law. Somewhat exceeding 2 miles eastward of this, at Allenheads the top of the great limestone is 230 feet from the top of a shaft called Gin-hill Shaft. Its thickness, which is tolerably uniform over several hundred square miles of country, is about 60 feet, and it is from this stratum of limestone that nearly all the specimens in this collection have been obtained.

The dislocations of strata which constitute for the most part important mineral veins, are exhibited more in detail in the series of geological models which form a part of this collection; but some of the great features of displacement may be noticed on the section.

At about a quarter of a mile to the west of, or left-hand direction from, Kilhope Law, the great limestone and all other associated beds are thrown down a depth of about 150 feet for a space of nearly 700 feet; and again, at the distance of nearly a mile from Allenheads, a vast dislocation takes place, by which the great limestone, it will be seen, is brought nearly to the surface, the amount of displacement being about 400 feet. It is in the great limestone that by far the most extensive portion of the workings of Allenheads lead-mines are situated, and the galleries drawn on the section convey a general idea of the position of the mines. In a great thickness of strata above the great limestone only two beds of that rock are found. One of these is called "little limestone;" it is from 10 to 12 feet thick, and is 75 feet above the top of great limestone; the other is still more inconsiderable, being only 3 or 4 feet thick, and is 440 feet above the great limestone. It is remarkable with what exactness this thin bed is found near the summit of hills, the intervening spaces having apparently been removed by denudation, so as to form in one case a gap of 6¼ miles, and in another of 1¾ miles, in which the Tell Top limestone is entirely cut off.

But beneath the great limestone, as will be seen by the lines of blue colour, are several beds of the same description of rock, viz., at distances respectively of 30, 106, 190, 250, and 287 feet, and the thickness 2, 24, 10, 15, and 35 feet. These are known by descriptive local names, and comprise all that are of significance as regards lead-mining operations.

The Allenheads mines being situated for the most part at depths from the surface varying from 200 to 600 feet, are drained partly by ordinary water-wheels, some of which are shown on the section, and partly by the new hydraulic engines invented by Mr. W. G. Armstrong, and four of which are now in use for draining and other mining purposes at Allenheads mines.[*]

THE ISOMETRICAL PLAN AND SECTION of Nentsberry, by the exhibitor, is intended to exemplify the manner in which isometrical projection may be used in the delineation of mines and mining districts. In ordinary plans and sections, only one plane, or set of parallel planes can be truly represented, but by this method of projection three several planes may be combined in one drawing, and lines crossing at right angles, as, for instance, north and south lines intersecting east and west lines, may be correctly projected, and vertical lines added on the same projection.

The area represented by this drawing is about one-fourth of a square mile, each side being nearly half a mile in length. It is situated on the River Nent, midway between the source of that river at Nenthead and the market town of Alston. It includes some of the most interesting and prominent features of the strata and mines in that district, and amongst others the aqueduct called Nentfine Level, originally projected by the celebrated Smeaton, the engineer, who held the agency of these mines in 1775.

A copy of this section is deposited in the Government Office of Mining Records, and a further account of the several mining and other details is given in vol. ii. of "The Transactions of the Natural History Society of Northumberland, Durham, and Newcastle-upon-Tyne."

II. MODELS TO ILLUSTRATE MINERAL VEINS.—Plans and sections, although of great use, and indeed indispensable for all well-conducted mining operations, are yet incapable of conveying information relative to solid forms in so complete a manner as may be accomplished by the use of models, which are, in fact, a reduced representation of the actual form of objects. The utility of models is further increased when they are made in separate portions, so as to admit of being dissected and put together again. By this means, not only the surface of the earth, but even the interior of mines may be correctly represented.

The models contained in the series now exhibited are exact duplicates of a series made for the Museum of Practical Geology, and copies of which, on a smaller scale, are published. The details which accompany the published models may be had separately; and the following catalogue briefly indicates the principal points illustrated, as having a bearing upon the lead-mining districts:—

---

[*] See Transac. 1850 and 1851.

MODEL No. 1 represents a square mass of part of the carboniferous, or mountain limestone strata. The little and great limestone are both represented in this model, and the upper portion admits of being removed to show the result of the extensive denudation which is so conspicuous throughout the mining dales of the north of England.

MODEL No. 2 represents the principal seams or beds of coal in the district east of the lead-mines of the north of England, and situated, as regards geological sequence, above the mountain limestone strata.

MODEL No. 3 separates into four sections, in order to illustrate the displacement of strata by what is called the "throw" of mineral veins, and the effects of denudation, which take away all surface indications of such displacement.

MODEL No. 4 is intended to illustrate the deceptive appearances which are often presented at the surface by the successive outcrop of the same beds of coal, limestone, or other strata. Conditions which require the most careful considerations in agriculture as well as mining, and which are especially deserving of attention in the exploration of newly discovered lands.

MODEL No. 5. Dislocations of strata require not only to be studied as regards the virtual section, but also as regards both horizontal and inclined planes. Whether the object of search be coal, limestone, or any other member of a series of stratified rocks, it will be obvious, on examining the divisional plane of this model, that an adit or level may be driven upon this plane so as to intersect the desired stratum, or wholly avoid it.

MODEL No. 6. This represents the intersection of mineral veins and the disruption of strata caused thereby. The apparent shifting of a vein from its ordinary bearing is here shown to be only a result of ordinary mechanical displacement.

MODEL No. 7 represents the surface denudation of mineral veins, by which an apparent complexity of form is introduced, as regards the outline of the strata on the curved contour of the surface.

MODELS 8 to 12 represent various conditions of stratified rocks in relation to their inclination, as compared with that of the surface, presenting conditions highly explanatory of facts which are of constant occurrence in mining, and of the first importance in geological surveys; but any detailed explanation of such phenomena would exceed the proper limits of this description.

III. MINERALS ASSOCIATED WITH LEAD ORES.—The plans, sections, and models already described convey a general idea of the geological and mining conditions of the district from whence the specimens illustrative of lead-mining have been chiefly obtained. The remainder of the collection is arranged with a view to exhibit, first, THE PRODUCTIONS upon which the industry of the lead-miner has to be exercised; secondly, THE PROCESSES by which he renders these productions fit for use; and thirdly, THE RESULTS of his labour.

In considering the best manner of following out any classification of this natural order or arrangement, the exhibitor had in view to exhibit the first named in a separate case, containing labelled specimens of the principal rocks, ores, and spars of Allendale and Alston, then in a series of cases to show the various processes, and finally, in another separate case, corresponding with the first, to exhibit the finished products of lead and silver. As regards the second and third divisions of this arrangement no alteration was made; but the first, now under description, was modified and altered under the following circumstances.

A number of agents and other parties interested in lead-mining, and chiefly residing in Alston Moor, were anxious to send a collection of minerals collected from lead-mines to the Exhibition, and a working miner, Mr. Isaac Robinson, who was one of the parties, was anxious to fit up this case in a manner corresponding to some small collections which he had cemented together, and which had been much admired. As such a collection formed, in point of fact, the essential feature of the first division, which had been contemplated, being specimens of the minerals associated with lead, it was considered, at a meeting of the parties concerned, that it should be fitted up as proposed by Mr. Isaac Robinson, under the general superintendence and direction of the exhibitor and others. This was accordingly done, and the case contains upwards of 2,000 specimens fitted together, not as a representation of any particular cavern, but grouped so as to present to view an example of almost every mineral substance usually found in immediate connection with lead-ores. Some of the examples are interesting as ornamental spars. But spars are not alone useful as ornaments: they are partly used in the arts, and they also afford instructive indications in tracing the course of mineral veins. The whole of this case was cemented together by Mr. Isaac Robinson during the intervals of his ordinary hours of work.

IV. EXAMPLES OF THE VARIOUS STAGES OF PROGRESS FROM THE MINE TO THE MARKET.—This part of the collection is arranged in five cases, each containing six boxes of one square foot each, being in all thirty boxes.

Fifteen of these boxes, in a line furthest from the front edge of the counter, contain specimens of lead-mining from the excavation of the ore in the mine, and showing the several stages of progress until ready to send to the smelt-mill; and the other fifteen boxes, in a line nearest to the front of the counter, contain specimens of the ore as prepared for smelting, and its various stages of progress, until manufactured into lead and the silver separated; these finished products being contained in Division No. 5 of this collection.

CASE No. 1.—Lead ore, as first separated from the vein in which it is found, and which in this state is called "bouse" in the north of England lead-mines, and the places in which it is deposited at the surface are called bouse teams. The depositing of the ore in these places is greatly facilitated at Allenheads by the use of tipping frames, of a new construction, by Mr. W. G. Armstrong, of the Elswick Engine Works, near Newcastle-on-Tyne. This example is from a "flat" vein in Allenheads mines, in the great limestone, which rock forms the curiously laminated matrix with which the ore is intermixed. The ore and rock thus intermixed require to be separated, as is exhibited by the following examples. By a flat vein, or "flatts," is meant a horizontal extension of mineral substances to a considerable distance from the ordinary vertical or steeply inclined veins, which extend in the manner of fissures through the various beds of rock forming the district. The regular lamination of the ore is worthy of attention, as leading to speculations on the origin of mineral veins; a subject of great practical importance. The example here shown is taken from a part of the "flatt workings," at a distance of about 20 feet from the principal or nearly vertical part of the vein.

CASE No. 2. "Bouse," or lead ore, as extracted from the vein, and showing an example of the curiously polished surface, which is a frequent characteristic of veins, and which would appear at first sight to have been very carefully polished by artificial means, many of the surfaces being sufficiently clear to reflect the images of objects in a tolerably definite form. The local name of such bright and polished surfaces is "*slickensides;*" and the suggestion mentioned in the notice of the last specimen, as to the value of scientific inquiry, applies with still greater force to the class of phenomena of which this is one of the most curious indications.

CASE No. 3 contains a portion of the ordinary bouse, or ore, as newly worked from the vein, and much intermixed with the materials contained in Cases 1 and 2, as well as with other earthy and sparry contents of veins. The produce of mineral veins varies from pure galena, of which some pieces are shown, to masses of rock in spar, in which the ore is so thinly disseminated as not to repay the trouble of extraction.

CASE No. 4. The intermixed rocks and ores shown in the preceding cases are first subjected to "picking," and then to "washing," on a grate. The first of these operations separates from the general mass all such pieces of galena as are either not mixed with other substances, or which can be readily separated with a hammer on what are called "knocking-stones," and the second has the effect of clearing away all earthy matter. These specimens, picked from the heap and washing-grate, are ready for smelting after being reduced with a hammer to the size of the ore contained in Case No. 9.

CASE NO. 5 contains ordinary "bouse," or lead ore taken from the *trunking-box* after passing through the *washing-grate*, being, in fact, a process of *washing and sizing*, with a view to the further operations exhibited in the following cases.

CASE NO. 6 contains specimens of ordinary bouse, which from the size of the pieces and intermixture of rock and ore, require to be passed through the rollers of the crushing-mill.

CASE NO. 7. Specimens of the same bouse, or ore, after having passed through the rollers of the crushing-mill.

CASE NO. 8. So far the processes have consisted simply of extraction of the ore from its place in the mine,—of the pure samples of ore being picked out and washed and sized, ready for being smelted at once, without further operations,—of the remainder or poorer samples being washed and separated by an iron grate or sieve into two sizes, the larger having to be ground between rollers to reduce it to the same size as the smaller, which had passed the grate, and when reduced to this stage, the whole is ready for an operation called "hotching," which consists in placing the ore in a tub with water—the bottom of this tub is a sieve—and the whole is subjected to a rapid vibratory vertical movement, or shaking, by which a separation of the ore takes place. The water so far lessens the weight as greatly to facilitate the downward movement of the ore, which of course is much heavier than the spar and other materials connected with it. The vibratory movement is sometimes given by manual labour: a long arm, moving with a spring, is jerked up and down by a strong lad jumping on a raised stand, so as to produce the required motion. The same results may be obtained by machinery; and a model of a hotching apparatus accompanies these specimens. It represents the mode in which the hotching tubs are worked in some of Mr. Beaumont's mines in West Allendale; and both the mode of applying the machinery, and the manufacture of the model representing it, are due to the ingenuity of Mr. Joseph Hetherington, one of the engineers or wrights employed at these mines.

The ore prepared as has already been described, and after being shaken in the "*hotching-tub*," the upper part is entirely waste or refuse, and is called "cuttings," of which this case, No. 8, contains a specimen.

CASE NO. 9 contains lead ore as obtained from the bottom of the hotching-tub, and is ready for being smelted.

CASE NO. 10 contains what is called "undressed smiddum," being what has passed through the sieve of the hotching-tub into the box or case of water in which the hotching-tub vibrates.

CASE NO. 11 is the "smiddum," after being dressed or cleared from all foreign substances in what is locally called a "buddle," and the ore, in being so washed, is said to be "buddled."

CASE NO. 12. In all operations where a stream of running water is employed to wash lead ores, it is obvious that many of the smaller particles will be carried away with the stream. These particles are allowed to settle by their specific gravity in what are called slime-pits, being merely reservoirs in which the water passes over a long space with a very tranquil movement. In the Case No. 12 is an example of the *slime* or deposit in these slime-pits, undressed.

CASE NO. 13 contains a specimen of what is called "slime ore," having been extracted or separated from the slime shown in Case No. 12. This separation is effected by manual labour in what are called "*nicking-trunks*," and is made ready for a final washing or separation in the "dolly-tub."

CASE NO. 14 contains slime ore obtained, not by manual labour, but by means of a patented invention of Mr. Brunton's, by which the slime, being first freely mixed with water, is allowed to fall on a revolving canvas cloth, inclined at a moderate angle, and upon which also drops of water are constantly falling, so as to keep the surface well wetted. The heavier particles of ore being thus free to move, are carried *up* the slightly inclined surface of the canvas, and so pass round a roller to a cistern below, in which they are deposited, while the lighter particles of earthy matter and spar are at once carried *down* the canvas by the stream of water. The ore thus obtained requires finally to be washed in the dolly-tub, after which it is fit for being smelted.

CASE NO. 15 contains slime ore as taken from the dolly-tub, which is the last operation connected with the washing and dressing of lead ores, as usually practised in the lead-mines belonging to Mr. Beaumont, and in the lead-mines generally of this part of the kingdom.

The German buddle is also occasionally used in dressing slime ores. A considerable improvement was made in this apparatus about 30 years ago by Mr. Robert Stagg, of Middleton, in Teesdale.

CASE NO. 16 exhibits a specimen of "selected" or superior lead ore, in the form in which it is sent to and deposited at the smelt-mill, ready to be smelted.

CASE NO. 17 contains an example of the ordinary or common lead ore, as prepared and ready for smelting.

CASES NOS. 18 and 19 contain the same ores (select and common) after having undergone the operation of being "*roasted*," or exposed to a suitable temperature in a reverberatory furnace, the object being to free it from the sulphur contained in galena, pure specimens of which consist of lead 86·6 and sulphur 13·3. By this process the ore is rendered more easily reducible.

CASE NO. 20. Grey slags formed in the process of ore hearth smelting, and from which the lead is afterwards obtained at the slag hearth.

CASE NO. 21. Black slags, being the residuum obtained from the slag hearth, and which assume the granulated form from being made to flow, when in a melted state, into water.

CASES NOS. 22 and 23 contain examples of the crystals of selected and common lead, as formed in the process of separating or desilvering the ore: patented by Mr. H. L. Pattinson, and first brought into operation at Mr. Beaumont's smelt-mills.

CASES NOS. 24, 25, and 26, contain specimens of the fume or deposit in the long flues connected with the smelt-mills: that in No. 24 being the ordinary fume collected in the flue, No. 25 the same, after being roasted for the ore hearth, and No. 26 the same, roasted for the slag hearth. The flues or chimneys are built of stone, 8 feet by 6 feet inside, and are upwards of 8½ miles long.

CASES NOS. 27, 28, and 29.—Litharge in the ordinary round state, and two varieties of *Tinsed litharge* which have been passed through a sieve.

CASE NO. 30.—Skimmings from the surface of melted lead, showing iridescent hues, which are frequently of great intensity and beauty.

V. LEAD AND SILVER PREPARED FOR SALE.—The following are contained in the large upright case which completes the several objects sent in illustration of lead-mining, viz.:—

No. 31. LEAD made from roasted lead ore, and placed in a model-mould, same as No. 37.

No. 32. Grey slag lead, in mould.

No. 33. Selected lead, in mould.

No. 34. Common lead, in mould.

No. 35. Lead made from ore-hearth fume, in mould.

No. 36. Lead made from slag-hearth fume, in mould.

No. 37. Empty mould, marked W. Blackett, which name, or its initials, viz., W. B., form the well-known mark of the lead produced from Mr. Beaumont's mines.

No. 38. A pig, or piece of common lead, weighing 12 stones, or 1½ cwt.

No. 39. A pig, or piece of selected lead, weighing 12 stones, or 1½ cwt.

In the above examples, Nos. 31 to 37 are models of reduced size. The dimensions of the ordinary pieces of lead, as manufactured for sale, are shown in Nos. 38 and 39. The number of pieces usually manufactured at these mines in a year, if laid in one continuous line, would extend upwards of 70 miles in length.

No. 40. A cake of silver produced from lead raised in Mr. Beaumont's mines, and weighing 8,000 ounces.

485 OXLAND, ROBERT, *Buckland Street, Plymouth*—Inventor and Manufacturer.

A series of specimens illustrative of an improved process for dressing ores of tin; containing wolfram (the tungstate of iron and manganese). Invented by the exhibitor, for the separation of the wolfram from the ores of the Drake Walls Tin Mine, on the Cornish side of the river Tamar. This process is now in regular operation at the mine. In consequence of the specific gravity of wolfram, which is from 7·100 to 7·500, being greater than that of the black tin of the mines or the pure native oxide of tin, which is only from 6·3 to 7·06, it has been found impossible to separate the wolfram from the tin oxide by the usual mechanical process of washing in a stream of water. This led to the necessity of adopting the patent chemical process explained with the description of the series of specimens.

No. 1. "Tin witts:" the ore obtained from the stamp floors, where, subsequently to its having been crushed or stamped down to a suitable size, it has been washed in a stream of water, in order to separate the earthy particles with which it was associated. The clean "witts" contain native oxide of tin; black tin, or rosin-tin and wolfram, with iron and arsenical pyrites, generally containing some copper. In the course of washing, the "witts" are sorted into different parcels, according to the size of the particles, and are known as jigged, marked A; flucan, B; smalls, or "smales," C; slime, D; roughs, or rows, E. The "witts" are calcined in a reverberatory furnace, usually constructed of fire-brick throughout, but the furnace, of which a drawing is exhibited, has been found to be as well adapted for this purpose, as for the process for which it was originally intended. The calcination is continued until all the sulphur and arsenic is evolved.

The residue No. 2 contains black tin, or native tin oxide, peroxide of iron, wolfram, some sulphate of copper, and a small quantity of earthy matter. By a series of washing operations on the burning house floors, the peroxide of iron, sulphate of copper, and earthy matters are removed, and the product obtained is No. 3, which consists of oxide of tin, with most of the wolfram. The process is in the next place employed for the removal of the wolfram. Its proportion having been ascertained by analysis, a quantity of sulphate of soda, or salt cake, is mixed with the ore sufficient to supply a slight excess of the equivalent of soda for the quantity of tungstic acid present; but with the sulphate of soda, must be mixed sufficient coal dust or charcoal to afford carbon or carburetted hydrogen, for the decomposition of the sulphuric acid and the conversion of sulphate of soda into sulphide of sodium. The mixture is exposed to heat on the bed of the furnace described below; a smoky or reducing flame is at first employed, but after the whole of the charge has been at a red heat for some time, an oxidating flame is necessary to complete the operation. Thus the sulphate of soda is first converted into sulphide of sodium, then the tungstic acid of the wolfram combines with the soda, producing tungstite of soda, setting the sulphur free as sulphurous acid, and leaving the iron in the condition of a light finely divided peroxide.

The product No. 4, is drawn from the furnace into the wrinkle, or chamber beneath, and is thence removed whilst still hot into tanks containing water, which quickly dissolves the tungstate of soda. The solution is run off into receivers, and the residue is removed to the burning house floors, where, by a series of washings, the peroxide of iron is removed, and the native oxide of tin obtained pure and ready for the smelting house, as seen in No. 5. An ore which had fetched only 48*l.* per ton has by this operation been so much improved in quality as to obtain 58*l.* per ton.

The tungstate of soda, No. 6, is obtained in the crystalline form by the evaporation to the crystallising point of the solution in which it was separated from the tin. It is proposed to be used as a substitute for stannate of soda as a mordant for dyeing purposes.

Tungstic acid, No. 7, may be employed for the same purpose, or for the manufacture of tungstate of the tungstous oxide with soda, a compound much resembling gold.

The tungstate of lead, No. 8, and tungstate of lime, No. 9, are good white pigments (manufactured from the tungstate of soda), from which was also obtained the metallic tungsten, No. 10, and sulphuret of tungsten, No. 11. The former is for use in the manufacture of metallic alloys; the latter has been proposed as a substitute for black-lead. The furnace is constructed in the usual manner, excepting that a cast-iron bed has been employed to prevent the loss that would arise from the reaction of the silica of the bricks, the soda, and the tin oxide on each other. The fire, after passing over the bed, is also made to circulate beneath it before passing away to the chimney.

486 BRUCCIANI, D.—Producer.

Fac-simile of the largest piece of gold found in California.

486A IBBETSON, CAPT.—Producer.

A model of the Isle of Wight, in metal.

487 JORDAN, C., 37 *Chapman Street, Manchester*—Producer.

Case containing 176 specimens of the useful metals and alloys:—

Gold—Grain, standard, and red jewellers'.

Silver—Virgin and sterling. Platina.

Wrought iron—Best and common Coalbrook Dale; best scrap for screws and rivets; Low Moor and common Horton's; also, S. R., I. B., common, Horton's, and Keller's.

Steel for mills—Winders; cast steel, Turton's, and Turton's softened; and shear-steel, all showing surface and fracture.

Cast-iron—Rich Welsh pig, from Leeswood; and rich Scotch pig from Gartsherrie, Glengarnock, Clyde, Dalmellington, and Dundyvan; Yorkshire, Low Moor and Leeswood; cast in sand, chilled, pig, and rich chilled; also short pig, Staffordshire, rich mottled Welsh, and cast in sand, showing surface.

Nickel and Lead—Pure and commercial.

Copper—Tile, native, shot cast, and malleable, all showing surface and fracture.

Tin—Block and grain.

Zinc—Chilled and sand, showing surface and fracture.

Bismuth—Chilled and sand, showing surface and fracture.

Antimony—Chilled, showing fracture and longitudinal section.

Arsenic, cobalt, mercury, manganese, potassium, sodium, iridium and osmium, cadmium, and palladium.

Alloys—Copper and tin, in various proportions, showing surface and fracture, &c.

Alloys of copper, zinc, tin, and lead, in various proportions, showing the same.

Tutannia, for hardening tin, bobbin-bushes, &c.

White bush metal, of zinc, tin, and tutannia, variously combined.

Type metal, of tin, antimony, lead, and bismuth.

Stereotype metal, of lead, antimony, and bismuth, in various states.

Common type and music plates, of lead and antimony.

Compositions of copper, tin, zinc, and lead in different states.

Blanched copper, antimony and copper, and German silver, electrum, common and plate.

Standard measures, composed of copper, tin, and lead.

Manheim gold, of copper, tin, and zinc.

Speculum metal, of copper and tin, in various mixtures.

Specula of chilled copper and tin; Mr. Potter's, with trace of arsenic, and others.

Nickel and iron; fusible alloy; tutannia, for type-metal; iron and antimony; iron and zinc (not magnetic), will not rust; spelter solder; silver solder; tinman's and plumber's solder.

These specimens display the surface, and where practicable, the fracture of all the useful metals and alloys. Many of the alloys are new combinations, and are valuable in point of utility and economy. Some of the alloys are intended for the small steps of machinery, &c., composed of 16 oz. copper, 8 oz. zinc, 4 oz. lead, ½ oz. tin. This alloy has been used very extensively; it works well under the file and turning-tool; and its lasting properties are great. This is the cheapest metal that will answer for machinery purposes, especially if made from brass turnings. The alloy made from pig iron and zinc turns and files very well, and is adapted for shaft-bearings, particularly for such work as requires exposure to the weather. Portions of this metal have been exposed for several weeks without any appearance of rust. It is intended as a substitute for brass in many cases, being much cheaper. The magnetic properties of the iron are entirely neutralized; hence, for some purposes, it will be superior to any other metal or combination. In speculum metals, the proportions of Newton (163 and 164), when cast in a hot chill, will take a more brilliant polish, and retain the brilliancy longer than any other combination: being cast in a hot chill prevents too sudden contraction, and the brittleness so often experienced. These cabinets of metals and alloys are intended as illustrations for the lecture-table, and for general reference in the manipulations of metals.

488 **GARLAND, THOMAS**, *Fairfield, Redruth*—
Manufacturer.

Impure oxide of arsenic, obtained from tin ores (containing arsenical pyrites) by calcination.

Commercial oxide of arsenic, obtained from the foregoing by sublimation in reverberatory furnaces, and afterwards ground to an impalpable powder.

A finer quality of the preceding.

Lump arsenic, obtained from the preceding by sublimation in close retorts.

[Arsenic is found native occasionally, but is more frequently combined with other metals, of which iron, cobalt, nickel, silver, copper, antimony, and manganese are the chief. It is very soft but brittle, and volatilizes readily at a temperature of 365° Fahrenheit. It combines with oxygen in *white arsenic* (arsenious acid), and with sulphur in *realgar* and *orpiment*. The former substance is used in medicine, in the manufacture of glass, &c. The sulphurets are valuable pigments, both in dyeing and in the fine arts.—D. T. A.]

489 **LOWE, J.**, 30 *Gracechurch Street*—Part Proprietor.

Copper, from the exhibitor's patent works, Penclawdd.

490 **ROWLANDSON, THOMAS**, 7 *Esher Street, Kennington*—Patentee.

Bluestone — a compound of bisulphuret of iron, sulphuret of lead (galena), bisulphuret of copper, sulphuret of zinc (black jack), &c., some silver and gold, obtained at the Isle of Anglesey; also at the Vale of Ovoca, Wicklow, Ireland.

The zinc salts can be converted into chloride of zinc and sulphate of soda; these can be employed in a variety of forms for preserving animal and vegetable substances, deodorizing, &c.

Specimens illustrating the processes by which the sulphuret is converted into sulphate of zinc, which is washed out, and leaves the lead, gold, and silver to be extracted in the ordinary mode by smelting.

Specimens of ores and products from the Cwm-eisian Gold Mine, Merionethshire.

[The existence of gold in many of the rocks of Wales has been long known. There is every reason for believing that the Romans worked the mine at Gogofan, near Pumpsant, Caermarthenshire. This is not only proved by the remains of mine workings, which have been lately examined by the mining geologist to the Geological Survey, but by the gold ornaments which have been found in the Vale of Cothy, near this spot, which are evidently of Roman workmanship. The mine at Cwm-eisian yielded gold disseminated through the quartz, but not being sufficiently remunerative, the works have been abandoned.—R. H.]

491 **HARRISON, J.**, *Bakervale, Derbyshire*—Producer.

Lead ore, from Mogshaw mine, Bakervale.

492 **ROWE, RICHARD**, *Laxey Glen, Douglas, Isle of Man*—
Joint Proprietor.

Silver lead ore, and blende ore, being the produce of the Laxey Mines, in Laxey Glen, parish of Lonan, Isle of Man.

[Mines were worked at an early period in the Isle of Man, but the neighbourhood of Laxey first attracted attention at the commencement of the present century. In 1811, only three hands were employed; in 1848, there were at least 300 in the mine. The mine is situated about a mile and a half from the sea, up the Laxey Valley, where an adit is driven 400 fathoms into the heart of the mountain; from this adit the shaft has been sunk about 130 fathoms. The returns of lead ore for the last five years have been as follows:—

Years.	Lead Ore. Tons.	Lead. Tons.
1845	327	155
1846	220	104
1847	375	247
1848	695	461
1849	815	546

In addition to this, about 200 tons of the sulphuret of zinc are annually raised.—R. H.]

492A **COATES, W.**—Producer.

Specimens of lead ore from Tullyratty Mine, Strangford, Ireland, the property of Lord de Ros.

493 **CUMMING, J. G.**, *Isle of Man*—Producer.

Argentiferous galena, from the Foxdale Mines, containing 36 ounces of silver to the ton.

[This lead ore is procured from a granite vein, running N.N.W. and S.S.E., nearly magnetic; it improves in quality, and increases in quantity downward, which is an unusual occurrence. It is now being worked at 50 fathoms from the surface.—R. H.]

494 **BYERS, JOSHUA**, *Stockton-on-Tees, Durham*—
Producer and Manufacturer.

Lead ore from Grasshill Mine, Teesdale.
Silver and litharge from the same mine.
Refined, common, and slag lead.
Thin sheet-lead and lead pipe.

495 **BURR, THOMAS, WILLIAM, & GEORGE**, *Shrewsbury*—
Producers and Manufacturers.

Mineral specimen, raised at the Snailbeach lead mines, Shrewsbury, weighing 12 cwt., containing cubes of lead and zinc ore, in conjunction with carbonate and sulphate of barytes.

[The produce of the Snailbeach Mines since 1845 has been as follows:—

Years.	Lead Ores. Tons.	Lead. Tons.
1845	3,000	2,000
1846	3,852	2,700
1847	3,486	2,440
1848	3,463	2,436
1849	3,196	2,301

The returns for 1850 are not yet completed.—R. H.]

Composition tube, being an amalgam of certain metals, calculated to resist the action of acids contained in water or gas.

496 The **Duke of Devonshire**, and his Agent, Capt. **Eddy**, *Grassington*—Producers.

Specimen of the Devonshire lode at Grassington mines.

Specimen of the gritstone, in which the lead occurs.

Vein specimens from other lodes.

Transverse section of the Devonshire lode.

[The lode in the Grassington mines offers an exception to the common rule of lead veins in England, the whole produce being obtained in gritty beds alternating with the limestone and shale, and not in the limestone, as it usually occurs. The veins worked in this district are generally with faults, and the veinstone is chiefly calc spar, fluor spar, and barytes.—D. T. A.]

497 **Pattinson & Cain**, *Newcastle-upon-Tyne*—Producers.

Specimens of a peculiar ore of lead, viz., arsenio-phosphate of lead, rarely found in such large masses. From Dry Gill Mine, near Hesket New Market, Cumberland.

[This appears to be the mineral called by Breithaupt, Kampylite, an arseniate of lead, in which the arsenic is partially replaced by phosphorus.

The arsenio-phosphate of lead from this mine has been employed in glass manufacture, for the purpose of giving high transparency to the best flint or crystal, which appeared to be produced by the formation of a lead glass, which may be regarded as a phosphate of lead and silica. —R. H.]

498 **Bennett, Thomas**, 11 *Woodbridge Street, Clerkenwell*—Manufacturer.

Specimen of uniform leaf gold, manufactured by steam machinery, for gilding large plain surfaces, and for exterior decorations; of an extra deep colour, for gilding looking-glasses, cornices, &c.

499 **Smith, R.**, *Blackford, Perthshire*—Inventor.

Minerals from the Ochills, collected by the exhibitor. Two new alkaloids, "*cytisune*," found in the bark of the laburnum in combination with meconic acid; and euphorbine, from *Euphorbia officinalis*. Starch, from the tubers of the *Lunaria biennis*; and iodine, from the *Polytrichum undulatum*.

500 **Phillips, Smith, & Co.**, *Llanelly, Wales*—Manufacturers.

Series of specimens illustrative of the manufacture of tin plates.

[To prepare tin plates, sheets of iron are carefully cleaned from all oxidation and from every trace of organic matter: then being dipped into a saline solution, which serves as a flux, they are dipped into melted tin, which is diffused by heat over the surface, and the tin plates completed.]

Pig-iron, as received from the blast furnace.

Rough bar made from pig-iron, first melted and refined by blast and coke fuel, and converted into malleable iron in a charcoal fire, stamped and rolled into a rough bar.

Bar-iron made from the rough bar heated with blast and coke in a hollow fire, hammered and rolled into a finished bar.

Sheet-iron, known as black plate, rolled in case-hardened rolls from the bar-iron.

Black plate cleaned in a preparation of sulphuric acid passed through planished rolls, and softened by heating in pots previous to being coated with tin.

Sheet of black plate, partly tinned.

Wooden boxes, each containing a specimen of finished sheets of different sizes and thickness.

501 **Downman, H. H.**—Producer.

Wood impregnated with block tin.

502 **Jenkins, William Harry**, *Truro*—Producer.

Specimens of arsenic:—White arsenic, arsenious acid, used in glass manufactories, in patent shot manufactories, for washes for sheep, to preserve the wool and prevent the fly, and for preventing smut in wheat, &c.; white arsenic, in crystals, and sublimated, for the same purposes. Realgar, sulphuret of arsenic, used by painters as orange red pigment; orpiment, used by painters as yellow pigment.

Varieties of rarer minerals from various parts of Cornwall.

Specimens of wolfram from various tin mines in Cornwall, used as a mordant in dying calicoes.

Varieties of mundics, or pyrites, from various mines in Cornwall—Mangan Mine, an arseniuriet of iron. Wheal Withey, near Truro; Baldher Mine, near Truro; Royal Polberrow Consols Mine in St. Agnes; Wheel Andrew and Nangiles, near Truro, and others, a sulphuret of iron. Assorted specimens of pyrites of various qualities, from different mines, by the use of which, in combinations, a large produce of sulphuric acid is obtained.

[The arsenical pyrites, and the copper and iron ores containing arsenic, are the common sources for this substance. The ores are first roasted in "burning houses," and the volatile matters, sulphur and arsenic, collected in the flues. These are afterwards separated from each other by a more delicate process, so as to sublime one and not the other.

Wolfram, tungstate of iron, has only lately been introduced into the market. The tungstate of soda and tungstic acid are proposed to be employed as a mordant, and a new crimson pigment is an oxide of tungsten.— R. H.]

503 **Davey, Stephen**, *Redruth*—Miner.

Specimens of ores of zinc.

504 **Cole, Edward Joseph**—Producer.

Rich specimen of tin ore, estimated to contain 60 per cent. black tin, raised January, 1851, from Risehill mine, near Tavistock.

504a **Nicholson, Sir Arthur**, *Fetlar, Zetland*—Producer.

Specimens of clays, chromate of iron, black lead, and magnetic sand from Fetlar, Shetland Islands.

[The chromate of iron is chiefly used in the production of chromate of potash, the ore being cleaned, pounded, calcined with a certain proportion of nitre, and evaporated after lixiviation with water. From the neutral chromate thus obtained, or the bichromate, are produced chromate of lead (chrome yellow); a green oxide used as an enamel colour in porcelain (chrome green); and a beautiful vermilion (subchromate of lead). Chromic acid is also manufactured from the same mineral. Chromate of iron is obtained in England principally from the Shetland Islands.—D. T. A.]

505 **WILLIAMS & SONS**, *County Wicklow, Ireland*—Producer.

Sulphur ore; manganese ore, from Glandore Mining Company.

[What is here not improperly called "sulphur ore" is iron pyrites (sulphuret of iron), found very abundantly in and largely exported from the county of Wicklow. It is used to an enormous extent, in chemical works, for the manufacture of the various sulphur salts, as sulphate of soda, &c. The Wicklow pyrites is better adapted for such purposes than the Cornish, as it decomposes very readily on exposure.—D. T. A.]

506 **GREY, JOHN**, *Dilston, Corbridge*—Agent.

Blende and calamine from Alston Moor, Cumberland. Four plates of spelter, two whole, and two broken, produced from the same.

507 **GENERAL MINING COMPANY for IRELAND, THOMAS MAGUIRE**, Secretary, 2 *Burgh Quay, Dublin*—Producer.

Silver-lead ore (argentiferous galena), from Shallee mines, Tipperary; exported from Dublin to the river Dee, in North Wales. This ore produces 75 per cent. lead, and from 44 to 54 ounces of silver to the ton.

[The Shallee mines made their first return of lead in 1847, it being then 209 tons of lead ore, which produced 125 tons of lead. Since that time the quantity raised has been regularly increasing.—R. H.]

Silvery-copper ore (argentiferous sulphuret of copper), from Gurtuadyne, near silver mines, county Tipperary; exported from Dublin to Swansea, South Wales. This ore produces 12½ per cent. copper, and about 27 ounces of silver to the ton of ore.

Copper ore (sulphuret of copper), from Ballynoe, near silver mines, county Tipperary, exported from Dublin to Swansea, South Wales. Average produce, about 40 tons per month. This ore produces 25 per cent. of copper. Copper ore, from Lackamore, county Tipperary, similarly exported. This ore produces 36 per cent. of copper.

Specimens of all these ores, as taken from the mine, and as dressed for market.

508 **ROYAL DUBLIN SOCIETY OF IRELAND**.—Producer.

Specimens of lead ore in its various stages; lead, lead-pipe; patent shot; sheet of copper.

509 His Grace the **DUKE of BUCCLEUCH**, *Drumlanrig Castle*—Producer.

Model of the furnaces and pots employed on the Duke of Buccleuch's mines, at Wanloch Lead-hills, in Dumfriesshire, for separating pure silver from the rich lead ore of that district.

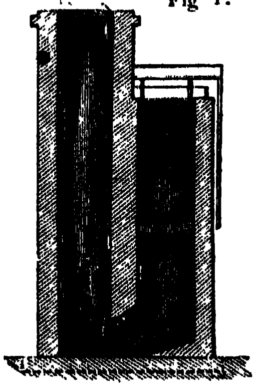

Fig 1.

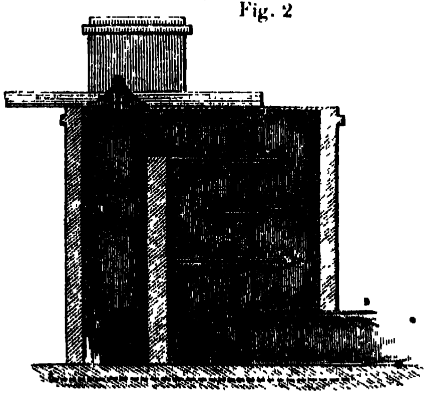

Fig. 2

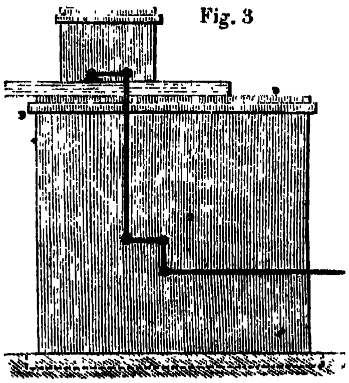

Fig. 3

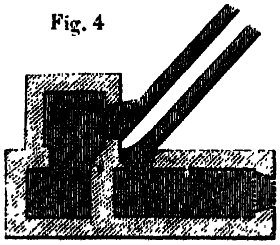

Fig. 4

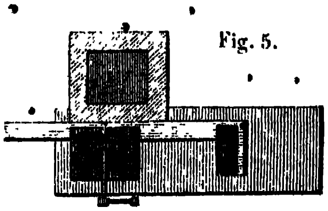

Fig. 5.

These engravings represent an elevation and sections of the peculiar arrangements adopted in these smelting works. Fig. 1 represents the section of the chimney with the flue entering it from below. Fig. 2 shows the arrangement adopted for deprecating the fumes as they pass upwards, and also the hydraulic trap at the summit of the vertical flue of the exhausting chamber. Fig. 3 shows the mechanical arrangement for communicating a reciprocating horizontal movement to the hydraulic slide plate over the top of the chamber. Fig. 4 shows the slide plate seen from above. Fig. 5 is a ground plan of the chambers, chimney, &c.

The following illustrations accompany the model.

A block of pure silver, weighing more than 140 lbs.; separated from the rich lead, and purchased by silversmiths as "unalloyed."

(*a*) Original lead as brought from the mines after smelting, containing 7 oz. 9 dwts. 8 grains of silver.

(*b*) Crystals of lead after passing through one process of crystallization.

(*c*) The same, after a second crystallization.

(*d*) Rich lead, containing 81 oz. 1 dwt. 8 grains of silver; and now ready for the last process of oxidization, by which the silver is finally separated from the lead.

(*e*) Marketable lead from the crystallizing process; and which contains from ⅓ to ⅔ of an ounce of silver per ton.

(*f*) Models of the great ingot moulds employed for forming the pigs of lead of commerce.

(*g*) Model of the great spoon-strainers employed for separating the pure, or nearly pure lead, from the molten liquid.

The operation depends upon the property which lead possesses in weak alloys of crystallizing at a certain temperature, by which means those crystals, at the moment of forming, can be extracted, and thus separated from the silver mass.

By a particular manipulation in transferring the concentrated lead and silver from pot to pot, the mass is at last reduced to an alloy, containing some 80 or 90 ounces of silver to the ton of lead, and much beyond which point it is not found advantageous to crystallize.

The rich lead is now simply melted in the refining furnace, on a very large cupel, formed of bone ash, exposing a great surface to the draught of air passing over it. The oxygen of the atmosphere is rapidly imbibed by the lead, which becomes the litharge of commerce. This is raked off as quickly as it forms; and finally, the silver is left perfectly, or very nearly, pure, and run into ingots for the market.

(*g*) Is the litharge or minium thus withdrawn from the melted surface.

Model of the lead vapour-condensing apparatus, at Wanloch Lead-mines, as improved by the exhibitor.

A collection of minerals from the Wanloch Lead-mines, or Lead-hills.

[In all great smelting works of this class, the smoke rising from the furnaces is highly charged with noxious vapours, containing, besides other poisonous matter, a large quantity of lead; many attempts have been made to obviate this nuisance, and the system adopted by the exhibitor has been found to be very successful.

An oblong building in solid masonry, about 30 feet in height, is divided by a partition wall, into two chambers, having a tall chimney or tower adjoining, which communicates with one of the chambers at the bottom. (See engraving.) The smoke from the various furnaces, eight in number, and about 100 yards distance from the condenser, is carried by separate flues into a large chamber; from thence, by a larger flue, it enters the first chamber of the condenser at the very bottom, and is forced upwards in a zigzag course towards the top, passing four times through a shower of water constantly percolating from a pierced reservoir at the summit of the tower. The smoke is again compelled to filter a fifth time, through a cube of coke some two feet square, through which a stream of water filters downwards, and which is confined to its proper limits by a vertical grating of wood.

The smoke having reached the top, is now opposite the passage, into the second, or vacuum chamber. This is termed the exhausting chamber, and is about five feet by seven feet inside, and 30 or more feet in height. On its summit is fixed a large reservoir, supplied by an ample stream of water, always maintaining a depth of 6 to 10 inches. The bottom of this tank is of iron, having several openings, or slots, 12 in number, about an inch in width, and extending across the whole area of the reservoir, communicating directly with the chamber beneath. On this iron plate, works a hydraulic slide-plate, with openings corresponding in one position with those in the reservoir. This plate receives a horizontal reciprocating motion from a water-wheel or other power, driven by means of a connecting-rod and crank.

In the middle of every stroke, the openings in the plate correspond with those in the bottom of the reservoir, and a powerful body of water falls as a shower bath, the whole height of the vacuum chamber, and in doing so, sweeps the entire inside area, carrying with it every particle of insoluble matter held suspended in the vapours coming from the furnaces.

The atmospheric pressure, of course, acts in alternate strokes as a blast at the furnace-mouths, and causes a draught sufficiently strong to force the impure vapours, through the various channels, in connexion with the water, the wet coke and exhausting chamber, until it passes purified and inert into the atmosphere.

The water, saturated with particles of lead, &c., held in mechanical solution, finally passes into great dykes or reservoirs, excavated for the purpose; and there deposits its rich charge of metal.

(*h*) Is the lead collected from this "fume," or deposit, which contains about 33 per cent. of pure lead, and about 4 oz. 17 dwts. and 7 grains of silver to the ton.

(*i*) The condensed fume roasted.

The results of this arrangement are most apparent, and beneficial to the surrounding neighbourhood. Formerly, the noxious fumes passing from the shafts of the furnaces, poisoned the neighbourhood; the heather was burnt up, vegetation destroyed, and no animal could graze, or bird feed near the spot. Now, the heather is seen in luxuriance close around the establishment, the sheep graze within a stone's throw of the chimney's base, and game on all sides take shelter.—J. A. L.]

510 WALLACE, WILLIAM, & COWPER, T., *Nenthead, Alston*—Proprietors.

Carbonate of lead, from Little Eggleshope Lead Mine, in Teesdale, county of Durham.

Minerals from Alston.

511 BARRETT, Captain—Producer.

Cobalt and copper ores from Conniston mines, near Kendal, Lancashire.

512 BLEE, R., *Redruth*—Producer.

Cobalt ores, from Cornwall.

513 LISKEARD COMMITTEE—Producers.

Various specimens, including iron pyrites; hornblende, and antimony.

514 MUSCHAMP, WILLIAM, *Derwent Lodge, Sunderland*—Producer.

Specimen of Cally copper ore, a portion of a large block weighing 6 cwt., recently raised at the Cally mines, near Gatehouse of Fleet, Kirkcudbrightshire, Scotland. The rock in which it is found, is brown killas, or clay slate. The lode is from 2 feet 6 inches to 4 feet wide, and is composed of sulphate of barytes, gossan, and other mineral soils. The ore generally lies in solid ribs or bunches, and is mostly unmixed with any matrix or vein stuff. In some places it has been found 4 feet wide. The ore is of very rich quality, being a compound of the green and blue carbonates of copper, black, grey, and yellow copper, yielding from 25 to 30 per cent. of metallic copper. It has been sold in the market from 20*l*. to 25*l*. per ton.

515 DUBLIN SOCIETY—Producer.

Copper ore, from Knockmahon mines, Waterford.

516 TENNANT, J., *Strand*—Importer.

Copper ore, from Lake Superior.

517 **GRAHAM, JOHN**, *Barrhead, near Glasgow*—Producer.

Greenstone, showing native copper, as found in the rock when broken. Native copper, as found in the fissures and crevices of the rock, from Boyleston quarry, Renfrewshire.

[The greenstone of Renfrewshire occurs both above and below the coal-grits and coal. It is an intruded rock of variable but often very considerable thickness and extent, and is likely to contain small quantities of various metalliferous substances and native metals.—D. T. A.]

518 **BERGER, J.**—Producer.

Native copper, from the Lizard.

519 **BRUNTON, W.**, *Cornwall*—Inventor.

Safety fuse for blasting.

520 **COPELAND, G. A.**, *Pendennis, Falmouth*—Inventor and Manufacturer.

Safety blasting cartridges, adapted for all kinds of blasting; intended to afford protection to the workmen from premature explosions, &c. The expedition in search of Sir John Franklin was furnished with them, by order of Her Majesty's Government, for ice-blasting in the arctic regions.

521 **OFFLAHERTIE, H.**—Producer.

Lead ore, from Glengola mines.

521A **MURCHISON, J. H.**—Producer.

Specimens of copper ore from the island of Kawaw, New Zealand. Specimens of the matrix of the silver-lead ore at Beeralston, Devonshire.

522 **FORBES, A. C.**, *12 Old Burlington Street*—Producer.

Two specimens of Cinnabar, from the mines of New Almaden, in Upper California; one of 14lb. 1oz., the other of 13lb. 2oz. On analysis by Dr. Hoffman, they are found to consist of:—Mercury, 67·25; Sulphur, 10·33; Insoluble matter, 22·55. The insoluble matter consisting chiefly of silica, alumina, and traces of iron. On distillation with lime, 3,750 grains yielded 2,625 grains of mercury, or 70 per cent.

The mine has been worked one year; and in the month of November 1850, it yielded 127,500 lbs. of pure mercury. This is exported from San Francisco to the ports of Spanish America.

[Cinnabar is the only important ore of mercury, but is found in several states, sometimes in crystals, in laminated and granular masses, in a fibrous condition, and mixed with bitumen to the extent of 6 or 8 per cent. It is soft: specific gravity = 8·1 when pure, and is a sulphuret of mercury (Hg. S.). The mines of Almaden, in Spain, and Idria, in Carinthia, are those from which the chief supply has hitherto been obtained; but the discovery of mercury in the mountains on the coast of California, some years since, promises to affect the supply very considerably, when sufficient means are employed to work the mines extensively —D. T. A.]

523 **DAVIES & TAYLOR**, *Aberystwith*—Producers.

Specimens of lead ores.

[The Cardiganshire mines were worked at a very early period, probably by the Romans. Henry VII. encouraged mining by several grants, involving privileges to those who would work these mines. In the reign of Queen Elizabeth, there was a grant made of all these mines to Thomas Thurland and Daniel Houghsetter, Germans, who worked them for some time. They eventually passed into the hands of Sir Hugh Middleton, who realized a large profit by working them.

The present value of the Cardiganshire mines will be seen by the following list of their produce:—

MINES.	Lead Ore Returns.		Lead Returns.	
	Tons.	Cwts.	Tons.	Cwts.
Lisburne Mines	2,733	0	1,804	0
Cwm-y-stwyth	583	0	333	0
Esgair-hir	..		..

R. H.]

524 **HUNT, ROBERT**—Producer.

Mining map of Cornwall.

525 **ARKANSAS MINING COMPANY**—Producer.

Sample of Arkansas lead ore in a lump as cut from between the solid walls of a vein, measuring 24 by 20 inches, and 9 inches thick. Its weight is nearly 11 cwt. It contains also copper and iron ore, and the sulphuret of zinc, and is coated over with quartz mixed with barytes.

526 **HAWKE, E. H.**, *Scorrier, Cornwall*—Producer.

Specimens of safety fuse.

529 **KNIPE, J. A.**, *Clapham, Surrey*—Designer and Proprietor.

Geological map of the British Isles, and part of France. This map shows, besides the sites of the various mineral productions, and numerous geological sections of the soil (explained in English, German, and French), the inland navigation by rivers and canals, and the inland traffic by railways and principal roads; also, the soundings and tidal observations round the coast, from surveys by the Admiralty, Trinity House, and Dr. Whewell.

Geological and mineralogical map of England and Wales, with parts of Scotland, Ireland, and France. This map contains a select number of sections and notes of economic geology, the sites of minerals, and rivers, canals, &c., with their heights above the level of the sea. The preceding maps are published by H. Bailliere, 219 Regent Street; and Johnstons, Edinburgh.

530 **MARRIOTT, MRS. FREDERICK**, 3 *Eastbourne Terrace, Hyde Park*—Producer.

Specimen of gold ore from the Mariposa mine, California, estimated to contain 45½ per cent. of gold. Another specimen. (*Main Avenue East.*)

531 **DEVONSHIRE, Duke of**—Producer.

Large quartz crystal. (*Main Avenue East.*)

532 **ERSKINE, JAMES**, *Scotland*—Producer.

Specimens of lead ore from the Black Craig Mines.

533 **WEBB, JOHN & CHARLES**, *Rosoman Buildings, Islington*—Manufacturers.

Specimen of pipe as used at the exhibitors' soda-water works; and diagram of the London strata. (*South Wall.*)

534 **SAMUEL, M. A., Miss**, 23 *Norland Square, Notting-hill*—Producer.

Specimen of sulphate of iron from Shakespere's Cliff, Dover.

AN ACCOUNT OF THE NATURE AND EXTENT OF THE VARIOUS DEPOSITS OF MINERAL FUEL IN VARIOUS PARTS OF THE WORLD.

Accompanied by a Map, showing the extent and position of the principal Coal-fields of Europe and North America.

By D. T. ANSTED, M.A., F.R.S., &c., Prof. Geol., K.C.L.

1. *General Account of Materials used for Fuel.*

The chief supplies of valuable fuel are, and always have been, derived immediately or distantly from the vegetable kingdom. Whether in the form of wood, peat, lignite, or coal of various kinds, the original substance of all fuel has been found to have this origin, and thus it would seem that the power of vitality exerted in producing woody fibre has been from time to time stored up, as it were, into vast reservoirs, where it might be preserved safely and permanently for an indefinite period.

In warm climates, where the growth of vegetation is extremely rapid, and comparatively little fuel is needed: or in the early periods of civilization, before men congregate in large masses in towns, or are actively employed in manufacture, there is little need of more fuel than is supplied by the natural growth of forests; but under other circumstances, where forests are gradually removed, and the consumption of fuel at the same time increases, the reserved stores are greatly needed, and must ultimately be reckoned among the main sources of a country's wealth. The accumulations of mineral fuel in the British islands may be ranked as one of those natural advantages without which our country could not possibly have taken up and held for a long time the position she occupies among the nations of the earth; and thus, as one of the great and principal sources of its mineral treasure, the coal deposits of England demand and deserve our careful attention. The relative supply of other countries, and the activity and energy displayed in taking advantage of the existence of mineral fuel, must also be worthy of attention, as illustrating and explaining the condition of many manufactures, and the probable advance of the inhabitants of such districts in the refinements of civilization. Since the introduction of steam-power for all purposes of machinery, the consumption of coal has very greatly increased, and at present it would be difficult to set any limits to the use of so valuable a material.

The changes undergone by vegetable matter when buried in the earth and accumulated in large quantities, and the length of time needed to produce any marked alteration, are subjects rather more interesting, it may seem, to the chemist than to the practical man, who looks only for fuel that he may employ economically. But inasmuch as the real condition of coal varies considerably, and different kinds are valuable for different purposes, it is desirable that the whole history of coal and lignite beds, and of peat and turf, should be generally understood by every one using any or all of these substances extensively.

Vegetable matter consists of particles of carbon with minute proportions of several other elements arranged round minute cavities or cells, many of these being mechanically connected to form the varieties of vegetable fibre. A large quantity of water is also present, and so long as the vegetable lives there is a constant change and circulation of material particles kept up, replacing and renewing the different portions. When death takes place there is a tendency to decomposition, or the separation of the whole into minute atoms, having no further relation to each other. But this is frequently checked by various conditions, such as the presence of some substances derived from plants themselves, or the absence of sufficient oxygen gas to allow the change to take place, by mixing with the carbon, and becoming carbonic acid gas, the first step in the process of destruction. These causes operate constantly, but partially, and thus a large quantity of vegetable matter is always in the course of decomposition, while, in particular spots, a large quantity is constantly being accumulated. The latter condition is seen in our climate in the gradual but steady increase of peat bogs. The former is too common to require further notice.

2. *Peat and Turf.*

Accumulations of vegetable matter may be chiefly composed either of succulent vegetation, grasses, or marsh plants, or of trees, and the structure and condition of woody fibre is well known to be very different from that of grasses and succulent plants. There are thus two very distinct kinds of material preserved, the one undergoing change much less rapidly than the other, and perhaps much less completely. It is easy to prove that, from the accumulation of forest trees has been obtained the imperfect coal called lignite, while from marsh plants and grasses, mixed occasionally with wood, we obtain peat, turf, and bog. All these substances consist to a great extent of carbon, the proportion amounting to from 50 to 60 per cent., and being generally greater in lignite than in turf. On the other hand, the proportion of oxygen gas is generally very much greater in turf than in lignite. The proportion of ash is too variable to be worth recording, but is generally sufficiently large to injure the quality of the fuel.

As a very large quantity of turf exists in Ireland, covering, indeed, as much as one-seventh part of the island, the usual and important practical condition of this substance as fuel can be best illustrated by a reference to that country. This will be understood by the following account of its origin abstracted from the "Bog Report" of Mr. Nimmo. He says, referring to cases where clay spread over gravel has produced a kind of puddle, preventing the escape of the waters of floods or springs, and when muddy pools have thus been formed, that aquatic plants have gradually crept in from the borders of the pool towards their deep centre. Mud accumulated round their roots and stalks, and a spongy semi-fluid was thus formed, well fitted for the growth of moss, which now, especially spears of *Sphagnum*, began to luxuriate; this absorbing a large quantity of water, and continuing to shoot out new plants above, while the old were decaying, rotting, and compressing into a solid substance below, gradually replaced the water by a mass of vegetable matter. In this manner the marsh might be filled up, while the central or moister portion, continuing to excite a more rapid growth of the moss, it would be gradually raised above the edges, until the whole surface had attained an elevation sufficient to discharge the surface-water by existing channels of drainage, and calculated by its slope to facilitate their passage, when a limit would be, in some degree, set to its further increase. Springs existing under the bog, or in its immediate vicinity, might indeed still favour its growth, though in a decreasing ratio; and here, if the water proceeding from them were so obstructed as to accumulate at its base, and to keep it in a rotten fluid state, the surface of the bog might be ultimately so raised, and its continuity below so totally destroyed, as to cause it to flow over the retaining obstacle, and flood the adjacent country.

In mountain districts the progress of the phenomenon is similar. Pools, indeed, cannot in so many instances be formed, the steep slopes facilitating drainage, but the clouds and mists resting on the summits and sides of mountains, amply supply their surface with moisture, which comes, too, in the most favourable form for vegetation, not in a sudden torrent, but unceasingly and gently, drop by drop. The extent of such bogs is also affected by the nature of the rock below them. On quartz they are shallow and small; on any rock yielding by its decomposition a clayey coating, they are considerable; the thickness of the bog (for example in Knocklaid, in the county of Antrim, which is 1,685 feet high) being nearly 12 feet. The summit bogs of high mountains are distinguishable from those of lower levels, by the total absence of large trees.

As turf includes a mass of plants in different stages of decomposition, its aspect and constitution vary very much. Near the surface it is light-coloured, spongy, and contains the vegetable matter but little altered; deeper it is brown, denser, and more decomposed; and finally, at the base of the greater bogs, some of which present a depth of 40 feet, the mass of turf assumes the black colour, and nearly the density of coal, to which also it approximates very much in chemical composition. The amount of ash contained in turf is also variable, and appears to increase in proportion as we descend. Thus, in the section of a bog 40 feet deep, at Timahoe, those portions near the surface contained 1½ per cent. of ashes, the centre portions 3½ per cent., whilst the lowest four feet of turf, contained 19 per cent. of ashes. In the superficial layers, it may also be remarked, that the composition is nearly the same as that of wood, the vegetable material being but little altered, and in the lower we find the change into coal nearly complete. Notwithstanding these extreme variations, we may yet establish the ordinary constitution of turf with certainty enough for practical use, and, on the average specimens of turf selected from various localities, the following results have been obtained:—

The calorific power of dry turf is about half that of coal; it yields, when ignited with litharge, about fourteen times its weight of lead. This power is, however, immensely diminished in ordinary use, by the water which is allowed to remain in its texture, and of which the spongy character of its mass renders it very difficult to get rid. There is nothing which requires more alteration than the collection and preparation of turf; indeed, for practical purposes, this valuable fuel is absolutely spoiled as it is now prepared in Ireland. It is cut in a wet season of the year; whilst drying it is exposed to the weather; it hence is in reality not dried at all. It is very usual to find the turf of commerce containing one-fourth of its weight of water, although it then feels dry to the hand. But let us examine how that affects its calorific power. One pound of pure dry turf will evaporate 6 lbs. of water; now in 1 lb. of turf, as usually found, there are ¾ lb. of dry turf, and 1¼ lb. of water. The ¾ lb. can only evaporate 4½ lbs. of water; but out of this it must first evaporate the ¼ lb. contained in its mass, and hence the water boiled away by 1 lb. of such turf is reduced to 4¼ lbs. The loss is here 30 per cent., a proportion which makes all the difference between a good fuel and one almost unfit for use. When turf is dried in the air, under cover, it still retains one-tenth of its weight of water, which reduces its calorific power 12 per cent., 1 lb. of such turf evaporating 5¼ lbs. of water. This effect is sufficient, however, for the great majority of objects; the further desiccation is too expensive and too troublesome to be used, except in some especial cases.

The characteristic fault of turf as a fuel is its want of density, which renders it difficult to concentrate within a limited space the quantity of heat necessary for many operations. The manner of heating turf is, indeed, just the opposite to that of anthracite. The turf yields a vast body of volatile inflammable ingredients, which pass into the flues and chimney, and thus distribute the heat of combustion over a great space, whilst in no one point is the heat intense. Hence for all flaming fires turf is applicable, and in its application to boilers it is peculiarly useful, as there is no liability to that burning away of the metal, which may arise from the local intensity of the heat of coke or coal. If it be required, it is quite possible, however, to obtain a very intense heat with turf.

The removal of the porosity and elasticity of turf, so that it may assume the solidity of coal, has been the object of many who have proposed mechanical and other processes for the purpose. It has been found that the elasticity of the turf fibre presents great obstacles to compression, and the black turf, which is not fibrous, is, of itself, sufficiently dense.

Not merely may we utilize turf in its natural condition, or compressed, or impregnated with pitchy matter, but we may carbonize it, as we do wood, and prepare turf charcoal, the properties of which it is important to establish. The methods of carbonization are of two kinds;—1. By heating turf in close vessels; by this mode loss is avoided, but it is expensive, and there is no compensation in the distilled liquors, which do not contain acetic acid in any quantity. The tar is often small in quantity, and the gases are deficient in illuminating power, hence the charcoal is the only valuable product. Its quantity varies from 30 to 40 per cent. by weight of the dry turf. The products of the distillation of 1,157 lbs. of turf were found by Blavier to be—charcoal, 474 lbs., or 41 per cent.; watery liquid, 226 lbs., or 19·3 per cent.; gaseous matter, 450 lbs., or 39 per cent.; and tar, 7 lbs., or 6 per cent.; but the proportion of tar is variable, sometimes reaching to 24·5 per cent. when coked in close vessels.

The economical carbonization of turf is best carried on in heaps, in the same manner as that of wood. The sods must be regularly arranged, and laid as close as possible; they are the better for being large—15 inches long, by 6 broad, and 5 deep. The heaps, built hemispherically, should be smaller in size than the heaps of wood usually are. In general 5,000 or 6,000 large sods may go to a heap, which will thus contain 1,500 cubic feet. The mass must be allowed to heat more than is necessary for wood, and the process requires to be very carefully attended to, from the extreme combustibility of the charcoal. The quantity of charcoal obtained in this mode of carbonization is from 25 to 30 per cent. of the weight of dry turf.

The charcoal so obtained is very light and very inflammable; it possesses nearly the volume of the turf. It usually burns with a light flame, as the volatile matters are not totally expelled. This is shown by the composition of a specimen analyzed with the following result:—

Carbon	89·90
Hydrogen	1·70
Oxygen and nitrogen	4·20
Ashes	4·20
	100·00

For many industrial uses the charcoal so prepared is too light, as, generally speaking, it is only with fuels of considerable density that the most intense heat can be produced; but by coking compressed turf, it has been already shown that the resulting charcoal may attain a density of 1,040, which is far superior to that of wood charcoal, and even equal to that of the best coke made from coal. As to calorific effect, turf charcoal is about the same as coal cokes, and little inferior to wood charcoal.

It is peculiarly important, in the preparation of the charcoal from turf, that the material should be selected as free as possible from earthy impurities, for all such are concentrated in the coke, which may be thereby rendered of little comparative value. Hence the coke from surface turf contains less than 10 per cent. of ash, whilst that of the dense turf of the lower strata contains from 20 to 30 per cent. This latter quantity might altogether unfit it for practical purposes.

The above account of turf and its value, for which we are much indebted to the work of Sir Robert Kane, on the Industrial Resources of Ireland, will be found to apply in an important way to many experiments lately tried with this kind of fuel, and illustrated by several objects exhibited by Mr. Cobbold, Mr. Reece Rees, Mr. J. Rogers, and others. The products obtained for economic use, by the more careful distillation of turf and peat, will be fully described by reference to the body of the Catalogue.

3. *Lignite.*

Lignite also occurs in Ireland, especially on the shores of Lough Neagh, where it is partly used as fuel. The vast quantity of the lignite may be judged from a boring at Sandy Bay, described by Mr. Griffith. In 76 feet of depth there occurred three beds of lignite, one of 20, one of 25, and one of 15 feet thick, giving a total thickness of strata of fuel of 60 feet; the remaining 16 feet were clay. Elsewhere, the beds of lignite are not so much developed; but as the area of this tertiary basin extends over 100 square miles, the quantity of fuel therein contained may be considered of much public interest.

This lignite is intermediate between wood and coal, and is found on examination to present all the structure of wood, and is of a deep brown colour. When ignited, it gives off gaseous matter, which burns brilliantly, and leaves a dense black charcoal. Specimens are found to contain from 53·7 to 57·7 volatile matter, 30·0 to 33·6 carbon, 8 to 16 ash.

The economic value of the lignite appears from those analyses about two-thirds that of average coal. The heat which it produces is more diffused than that from coal, and less intense. Indeed, in all respects as to application to industrial uses, the position of lignite is between those of coal and wood. The attempts hitherto made to render this fuel available for various economic purposes have not been very successful.

At Bovey Tracy, in Devonshire, and at Brora, in Sutherlandshire, other beds of lignite occur, and have been partially used; and in various oolitic beds in Yorkshire similar mineral fuel exists to a small extent. None of these, as at present worked, present any features of considerable interest. Some beds of bituminous shale at Kimmeridge, Dorsetshire, and elsewhere, have been employed chiefly for local purposes.

But the lignite of Ireland is far inferior, both in extent and calorific power, to that of Germany, where fuel of this kind exists in several places, and to a vast extent. On the banks of the Rhine, in Nassau and its vicinity, and in the east of Europe, in Silesia, and in parts of Styria, deposits of this kind are exceedingly remarkable, and of great economic importance. Their thickness is sometimes enormously great, reaching to 120 feet, and even more, but the beds are generally detached and small, and more resemble drift accumulations than regular deposits. The value of these lignites for the manufacture of iron must ultimately be very considerable, as there exist abundant supplies of iron ore in the immediate vicinity of the fuel, both in Austria and on the Rhine, and also in Silesia.

The lignites of Germany often exhibit distinct woody structure, and can be referred to coniferous trees. They contain a somewhat large per centage of ash, do not form good and compact charcoal, and will not stand the blast of a blacksmith's forge. They are generally so wet as to require some drying before being used, and when exposed to the air they often crack. In texture they are tough, and sometimes exhibit sufficient remains of their origin as to resist effectually the blow of a hammer, or, if breaking, only parting in the grain of the wood. The change they have undergone has, therefore, been too small to have given them any of the essential characters of true coal, but they still are so far reservoirs of carbon that we cannot doubt of their being ultimately rendered available.

4. *Nature and Distribution of Coal.*

True coal is so much altered from its original vegetable condition as to have left scarcely any traces of its true history. It is generally, however, associated with sands and clays, exhibiting numerous fragments of the ancient vegetation that obtained at the time of its formation; but these fragments are so far removed in every respect with the existing form of vegetation, as to afford little clue to the ancient condition of the earth in this respect. In coal all trace of true woody fibre has disappeared; the water originally present, and so injurious in the less altered forms of vegetable fuel, is entirely absent, or, if present at all, is so rather mechanically than chemically, while the water originally in the plant appears to have undergone decomposition, the hydrogen uniting with some part of the carbon to form carburetted hydrogen gas, often existing in the cells and between the plates of the coal, under considerable pressure, and the oxygen being almost entirely removed. The former vegetable has now become a mineral substance, and lies in vast beds of variable thickness, and overlying each other to the extent sometimes of more than a hundred in a single district; such beds being regularly interstratified with deposits of sand and clay, and occupying a distinct geological position, being, with only a very few exceptions, confined to rocks belonging to the newer part of the palæozoic series.

Between the Arctic Circle and the Tropic of Cancer repose all the principal carboniferous formations of our planet. Some detached coal deposits, it is true, exist above and below those limits, but they appear, so far as we know, to be of limited extent. Many of these southern coal-fields are of doubtful geological age: a few are supposed to approximate to the class of true coals, as they are commonly styled; others are decidedly of the brown coal and tertiary period; while the remainder belong to various intermediate ages, or possess peculiar characters, which render them of doubtful geological origin.

The coals of Melville Island and Byam Martin's Island certainly appear to be of the true coal period. We know that coal exists at numerous intermediate points, from the 75th to the 27th degree of north latitude in America, and also that it is worked on the Sulado and Rio Grande rivers in Mexico, for the use of the steamers.

Southward of the Tropic of Cancer, the existence of coal, corresponding with the European and American hard coal, is somewhat uncertain. There seems to be none on the South American continent, unless it be at Ano Paser, which needs confirmation, or in the province of Santa Catherina, in Brazil. On the African continent we have had vague accounts of coal in Ethiopia and at Mozambique, also at Madagascar; and quite recently we have had intelligence of large quantities of coal in the newly-ceded territory above Port Natal, on the eastern side of Africa; but we believe no geologist has examined those sites. In the Chinese and Burmese empires only brown coal appears to approach the tropic, but true coal seems to exist in the northern provinces. Southward of the Asiatic continent we are uncertain of the exact character of the coal deposits, such as occur abundantly at Sumatra, Java, and Borneo, and neighbouring islands. Coal, however, exists in these islands, and is of fair workable quality.

In New South Wales, the great coal-range on the eastern margin of that continent has sometimes been described as resembling the Newcastle coal in England, and sometimes it is described as of more ancient date. This coal differs essentially from that of any known European formation, but bears a strong resemblance to the Burdwan coal of India.

We have not yet arrived at the period when we could pronounce with any approach to certainty on the actual number of coal-basins in the world; the total number must, however, amount at least to from 250 to 300 principal coal-fields, and many of these are subdivided, by the disturbed position of the strata, into subordinate basins.* These basins or coal districts are, however, grouped into a comparatively small number of districts, and even many of these are little known, and not at all measured. The greater number occur in Western Europe and Eastern North America, while Central and Southern Africa, South America, and a large part of Asia, are totally without any trace of true carboniferous rocks. The remarks, therefore, that will follow, chiefly refer to the coal of our own and adjacent countries, or of the United States and British North America.

There are various kinds of coal obtained from mines worked in the true coal-fields, which may be grouped into bituminous coal, steam coal, and anthracite. Of the first the cannel is a remarkable variety, the coarser kinds of it being called in Scotland "parrot," and sometimes splint coal. It contains from 40 to nearly 60 per cent. of volatile matter, and the proportion of carbon varies within the same limits. It burns readily, taking fire like a candle, and giving a bright light, and much smoke. The ash varies from about 4 to 10 per cent. This coal yields on destructive distillation a very large quantity of gas, and is profitably used for that purpose. The gas is not only large in quantity, but remarkably pure, and of excellent quality for purposes of illumination. There is a large quantity of this kind of coal in the Scotch coal-fields, and it has also been found in the Newcastle district, in the Wigan portion of the Lancashire coal-field, and in the Yorkshire and Derbyshire coal-fields. America yields cannel coal in Kentucky, Indiana, Illinois, and Missouri. Cannel coal passes into jet, and may like jet be worked into various ornaments; but it is brittle, and not very hard. The seams are generally rather thin, although there are several important exceptions in which the quantity is very considerable. The coal of Belgium from one basin (that of Mons) seems to be of this kind.

---

* Taylor's "Statistics of Coal," Introduction, p. xxxvii.

Another and far more abundant kind of bituminous coal is that obtained abundantly in Northumberland and Durham, and commonly used in London and everywhere on the east and south coast of England. This kind is also highly bituminous, burns with much flame, and takes fire readily, but it swells and alters its form while burning, often assuming a striking and very peculiar appearance, illustrated by a column of coke exhibited by Mr. Cory, and also by other cokes shown by the coal trade of Northumberland and Durham. This caking coal, as it is called, yields, on an average of several analyses, about 57 per cent. of carbon, about 37·6 volatile matter, and 5 per cent. ash. Its specific gravity is 1·257, but sometimes higher. It leaves a red ash in an open fire, but requires to be deprived of its volatile matter before being exposed to a strong blast, owing to its tendency to cement together in a solid mass, and prevent a free draft through the grate or furnace in which it is employed. Not only the coals of the Newcastle coal-field in England, but those of France and Belgium generally, of Bohemia, and Silesia, in Europe, and of Ohio, in North America, are of the caking bituminous kind.

The coal of Staffordshire, Yorkshire and Derbyshire, Lancashire, North Wales, and many other districts, contains nearly or quite as much bituminous and volatile matter as that of Newcastle, but does not cake and swell in the fire, and may, therefore, be employed directly where strong heat is required without previous coking. The coke obtained from this coal is little altered in appearance. The coal burns freely, will flame and give much heat, but is generally considered somewhat inferior for household purposes to that of Newcastle. It yields 50 to 60 per cent. carbon, 35 to 45 volatile matter, and a small quantity, often less than 5 per cent., of ash. The ash is often white. Most of the coals from the inland counties readily show white lines on the edges of the beds, owing to the pressure of argillaceous earth which effloresces. In this respect they are less adapted for general use than the Newcastle coal, but many of them are of excellent quality.

Next in order to the coals of the midland counties generally, are those of some parts of North Wales, and many districts in South Wales, which contain a larger per centage of carbon, very little volatile matter and bitumen, and often but little ash; which burn, however, freely and without smoke, and are well adapted for steam purposes and the manufacture of iron, or where a strong blast and great heat is required. Such coals exist not only in England, but in France, Saxony, and Belgium to some extent. They are often tender or powdery, dirty-looking, and of comparatively loose texture, but they often stand exposure to the weather without alteration or injury. They are called steam coals, and the inferior kinds are known as culm. They contain carbon 81 to 85, volatile matter 11 to 15, ash 3, or thereabouts. Several varieties well known in commerce are exhibited by different proprietors, and the respective analyses will be found in many cases in the body of the Catalogue.

The last kind of coal is that called "anthracite," and it consists almost exclusively of carbon. This coal is also called non-bituminous, as the steam coal is semi-bituminous. The anthracites contain from 80 to upwards of 95 per cent. carbon, with a little ash, and sometimes a certain small per centage of volatile matter. They are heavier than common coal, take fire with difficulty, but give an intense heat when in full combustion with a strong draught. Anthracite occurs abundantly in the western part of South Wales, in the south of Ireland, in France, Saxony, Russia, and in North America, and the use of them is greatly on the increase. Amongst other things it is used for hop and malt drying, and lime burning with great advantage, but its chief use is in the manufacture of iron. The appearance is often bright, with a shining irregular fracture; the coal is often hard, but some varieties are tender and readily fractured. The ash of anthracitic coal is generally white. As a general rule the anthracites are deficient in hydrogen, but contain a certain proportion of oxygen gas.

The following table represents the weight of water evaporated by one pound each of several principal varieties of coal, and is, therefore,—other things being the same—a good index of the relative value of these fuels:—

	Lbs.	Oz.
Common Scotch bituminous coal .	5	14
Hastings Hartley main, Newcastle .	6	14½
Carr's West Hartley, Newcastle . .	7	5
Middling Welsh anthracite . . .	7	15¼
Merthyr bituminous coal (South Wales)	8	0
Llangenech steam coal, South Wales .	8	14¼
Cameron's steam coal, South Wales .	9	7¾
Pure Welsh anthracite, South Wales .	10	8½

The relative importance of mineral fuel in various countries, as indicated by the actual coal area and the real production of different districts, may be understood by a reference to the subjoined table. This and other statistical facts are based chiefly upon the authority of Mr. Taylor,* but have before been given in their present form by the author of the present essay.†

COUNTRIES.	Coal Area in Square Miles.	Proportion of whole Area of the Country.	Annual Production in Tons.
British Islands	12,000	1–10	32,000,000
France	2,000	1–100	4,150,000
Belgium	520	1–22	5.000,000
Spain	4,000	1–52	550.000
Prussia	1,200	1–90	3,500,000
Bohemia	1,000	1–20	
United States of America .	113,000	1–20	4,000,000
British North America . .	18,000	2–9	

It will thus be seen how extremely important the coal-fields of the British islands really are when compared with any others elsewhere. This is the case not merely in the total annual production and the proportionate extent of the deposit, but also in the great number of points at which the coal can be advantageously worked. This will be best seen by reference to the table appended.

The beds with which the coal is generally associated in the British islands are various sands and shales (imperfect slaty beds) of different degrees of hardness; but the actual coal seams themselves often repose directly on clay of peculiar fineness, well adapted for fire-brick, and generally called under-clay. The under-clay is used in many coal districts for various purposes of pottery. Bands of ironstone (impure argillaceous carbonate of iron) are very abundant in certain coal districts, but are almost absent in others. The Scotch coal-fields near Glasgow, the South Welsh, Yorkshire, and some others, are rich in ironstone, which is the chief source of the vast quantities of iron manufactured in this kingdom.

* "Statistics of Coal," by R. C. Taylor (London, J. Chapman, 1850).
† "Elementary Course of Geology" (London, 1848).

TABLE of the Principal Coal-Fields of the British Islands.

	Estimated Workable Area in Acres.	Number of Workable Seams.	Estimated Total thickness of Workable Coal in Feet.	Thickest Bed in Feet.	Total thickness of Coal-bearing Measures in Feet.
1. Northumberland and Durham District:—					
Newcastle Coal-Field	500,000	16	80	7	.
2. Cumberland and Westmoreland, and West Riding of Yorkshire:—					
Whitehaven and Akerton	80,000	7	.	8	2,000
Appleby (three basins)	17,000	.	.	.	.
Sebergham (Cumberland)	.	1	3	3	.
Kirkby Lonsdale	2,500	4	17	9	.
3. Lancashire, Flintshire, and North Staffordshire:—					
Lancashire Coal-Field	380,000	75	150	10	6,000
Flintshire	120,000	5	39	9	200
Pottery, North Staffordshire.	40,000	24	38	10	.
Cheadle	10,000	.	.	.	
4. Yorkshire, Nottinghamshire, Derbyshire, &c.:					
Great Yorkshire Coal-Field	650,000	12	32	10	.
Darley Moor, Derbyshire	1,500	.	.	.	.
Shirley Moor					
5. Shropshire and Worcestershire:—					
Coalbrook Dale, Shropshire.	12,000	17	40	.	.
Shrewsbury	16,000	3	.	.	
Brown Clee-hill	1,300	3	.	.	
Titterstone, Clee-hill	5,004		.	.	.
Lickey Hill, Worcestershire.	650		.	.	.
Bewdley	45,000	.	.	.	.
6. South Staffordshire:—					
Dudley and Wolverhampton.	65,000	11	67	40	1,000
7. Warwickshire and Leicestershire:—					
Nuneaton	40,000	9	30	15	.
Ashby-de-la-Zouch	40,000	5	33	21	.
8. Somersetshire and Gloucestershire:—					
Bristol	130,000	50	90	.	.
Forest of Dean	36,000	17	37	.	.
Newent, Gloucestershire	1,500	4	15	7	.
9. South Welsh Coal-Field	600,000	30	100	9	12,000
10. Scottish Coal-Fields:—					
Clyde Valley	1,000,000	84	200	13	6,000
Lanarkshire					
South of Scotland, several small areas.					
Mid-Lothian	.	24	94	.	4,400
East Lothian	.	60	180	13	6,000
Kilmarnock	.	3	40	30	.
Ayrshire					
Fifeshire	.	.	.	21	.
Dumfries Coal Region	45,000	10	55	6	.
11. Irish Coal-Fields:—					
Ulster	500,000	9	40	6	.
Connaught	200,000	.	.	.	.
Leinster, Kilkenny	150,000	8	23	.	.
Munster (several)	1,000,000	.	.	.	.

The principal coal areas of Europe, apart from those of the British islands, are those of Belgium, France, Spain (in the Asturias), Germany (on the Ruhr and Saare), Bohemia, Silesia, and Russia (on the Donetz). Of these the Belgian are the most important, and occupy two districts, that of Liège and that of Hainault, the former containing 100,000, and the latter 200,000 acres. In each the number of coal-seams is very considerable, but the beds are thin, and so much disturbed as to require special modes of working. The quality of the coal is very various, including one peculiar kind, the Flenu coal, unlike any found in Great Britain, except at Swansea. It burns rapidly with much flame and smoke, not giving out an intense heat, and having a somewhat disagreeable smell. There are nearly fifty seams of this coal in the Mons district. No iron has been found with the coal of Belgium.

The most important coal-fields of France are those of the basin of the Loire, and of these, St. Etienne is the best known and largest, comprising about 50,000 acres. In this basin are 18 beds of bituminous coal, and in the immediate neighbourhood several smaller basins, containing anthracite. Other valuable localities are in Alsace, several in Burgundy, much worked by very deep pits, and of considerable extent; some in Auvergne, with coal of various qualities; some in Languedoc and Provence, with good coal; others at Arveyron; others at Limosin; and some in Normandy. Besides these are many others of smaller dimensions and less extent, whose resources have not yet been developed. The total area of coal in France has not been ascertained, but is probably not less than 2,000 square miles. The annual production is now at least 4,000,000 tons.

There are four coal districts in Germany, of the carboniferous period, besides several districts where more modern lignites occur. The principal localities for true coal are near the banks of the Rhine, in Westphalia; on the Saare, a tributary of the Moselle; in Bohemia; and in Silesia. The total annual production exceeds 2,750,000 tons.

Of these various localities, Silesia contains very valuable and extensive deposits of coal, which are as yet but little worked. The quality is chiefly bituminous, the beds few in number, but very thick, amounting in some cases to 20 feet. Some anthracite is found. Bohemia is even more richly provided than Silesia, the coal measures covering a considerable area and occupying several basins. More than 40 seams of coal are worked, and several of these are from four to six feet thick.

The basin of the Saare, a tributary of the Moselle, near the frontier of France, affords a very important and extensive coal-field, which has been a good deal worked, and is capable of great improvement. No less than 103 beds are described, the thickness varying from 18 inches to 15 feet. It is estimated that, at the present rate of extraction, the basin contains a supply for 60,000 years. On the banks of the Ruhr, a small tributary to the Rhine, entering that river near Dusseldorf, there is another small coal-field, estimated to yield annually nearly 1,000,000 tons. The whole annual supply from Prussia and the German States of the Zollverein, or Customs' Union, is considered to exceed 2,750,000 tons.

Hungary and other countries in the east of Europe contain true coal-measures of the carboniferous period; but the resources of these districts are not at present developed. On the banks of the Donetz, in Russia, coal is worked to some extent, and is of excellent quality, but it belongs to the older part of the carboniferous period.

Spain contains a large quantity of coal, both bituminous and anthracitic. The richest beds are in the Asturias, and the measures are so much broken and altered in position as to be worked by almost vertical shafts through the beds themselves. In one spot upwards of 11 distinct seams have been worked, the thickest of which is nearly 14 feet thick. The exact area is not known, but it has been estimated by a French engineer that about 12,000,000 of tons might be readily extracted from one property, without touching the portion existing at great depths. In several parts of the province the coal is now worked, and the measures seem to resemble those of the coal districts generally. The whole coal area is said to be the largest in Europe, presenting upwards of 100 workable seams, varying from 3 to 12 feet in thickness.

There are in North America four principal coal-areas, compared with which the richest deposits of other countries are comparatively insignificant. These are the great central coal-fields of the Alleghanies; the coal-field of Illinois, and the basin of the Ohio; that of the basin of the Missouri; and those of Nova Scotia, New Brunswick, and Cape Breton. Besides, there are many smaller coal-areas which, in other countries, might well take rank as of vast national importance; and which, even in North America, will one day contribute greatly to the riches of various States.

The Alleghany, or Appalachian coal-field, measures 750 miles in length, with a mean breadth of 85 miles, and traverses eight of the principal states in the American

Union. Its whole area is estimated at not less than 65,000 square miles, or upwards of 40,000,000 of acres.

The coal is bituminous, and used for gas. In Kentucky, both bituminous and cannel-coal are worked in seams about three or four feet thick, the cannel being sometimes associated with the bituminous coal as a portion of the same seam; and there are, in addition, valuable bands of iron ore. In Western Virginia there are several coal-seams of variable thickness, one, nine and a half feet; two others, of five, and others, of three or four feet. On the whole, there seems to be at least forty feet of coal distributed in thirteen seams. In the Ohio district, the whole coal-field affords, on an average, at least six feet of coal. The Maryland district is less extensive, but is remarkable as containing the best, and most useful coal, which is worked now to some extent at Frostburg. There appears to be about 30 feet of good coal in four seams, besides many others of less importance. The quality is intermediate, between bituminous and anthracitic, and it is considered well adapted to iron making. Lastly, in Pennsylvania, there are generally from two to five workable beds, yielding, on an average, about ten feet of workable coal, and amongst them is one bed traceable for no less than 450 miles, consisting of bituminous coal, its thickness being from twelve to fourteen feet on the south-eastern border, but gradually diminishing to five or six feet. Besides the bituminous coal, there are, in Pennsylvania, the largest anthracitic deposits in the States, occupying as much as 250,000 acres, and divided into three principal districts.

The Illinois coal-field in the plain of the Mississippi is only second in importance to the vast area already described. There are four principal divisions traceable, of which the first, or Indiana district, contains several seams of bituminous coal, distributed over an area of nearly 8,000 square miles. It is of excellent quality for many purposes; one kind burning with much light, and very freely, approaching cannel-coal in some of its properties; other kinds consist of caking, or splint coal. In addition to the Indiana coal-field, there appears to be as much as 48,000 square miles of coal-area in the other divisions of the Illinois district, although these are less known, and not at present much worked. 30,000 square miles are in the state of Illinois, which supplies coal of excellent quality, and with great facility. The coal is generally bituminous.

The third great coal-area of the United States is that of the Missouri, which is little known at present, although certainly of great importance.

British America contains coal in the provinces of New Brunswick and Nova Scotia. The former presents three coal-fields, occupying in all, no less than 5,000 square miles; but the latter is far larger, and exhibits several very distinct localities where coal abounds. The New Brunswick coal-measures include not only shales and sandstones, as is usual with such deposits, but bands of lignite, impregnated with vitreous copper ore, and coated by green carbonate of copper. The coal is generally in thin seams, lying horizontally. It is chiefly, or entirely bituminous.

In Nova Scotia there are three coal regions, of which the Northern presents a total thickness of no less than 14,570 feet of measures, having 76 seams, whose aggregate magnitude is only 44 feet, the thickest beds being less than four feet. The Pictou, or central district, has a thickness of 7,590 feet of strata, but the coal is far more abundant, one seam measuring nearly 30 feet; and part of the coal being of excellent quality, and adapted for steam purposes. The southern area is of less importance. Besides the Nova Scotia coal-fields, there are three others at Cape Breton, yielding different kinds of coal, of which one—the Sydney coal—is admirably adapted for domestic purposes. There are here 14 seams above three feet thick, one being 11, and one 9 feet.

Coal, existing generally in beds of moderate thickness, inclined at a small angle to the horizon, and often at very considerable depth beneath the surface, is extracted most commonly by the aid of pits or shafts sunk to the bed, and galleries (levels or drifts) cut horizontally, or in the plane of the bed to a certain distance. By a number of such galleries, cut at right angles to each other, the whole bed, within certain limits, is completely laid open, the overlying beds being supported by the masses of coal (pillars or columns) left untouched between the galleries. In this way about one-third of the coal can be extracted, and afterwards, on the supporting columns being also removed, the roof falls in, and the work is regarded as finished. This method is called technically "the pillar and stall method," and is adopted in the Newcastle coal-field. In Yorkshire, and elsewhere, instead of such columns being left, the coal is removed entirely, and at once, without columns; the roof falling behind the work as it advances. This is the long-wall method. Other modes are occasionally followed when the condition of the coal requires it.
